Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) “view” the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) “view” the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Adult Triage Criteria

(Adapted from the Canadian ED Triage and Acuity Scale)
1. Adult Cardiac Arrest Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient's individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Unresponsive
No Breathing or No Normal breathing
(i.e. only gasping)

Activate Resuscitation Team
Get AED/Defibrillator

CHECK PULSE
DEFINITE pulse palpated
within 10 secs?

Definite Pulse

• Open and maintain patent airway
• Give 1 breath every 6 seconds
• Recheck pulse every 2 mins
• Go to 2. Post Cardiac Arrest Care Algorithm

No Pulse

Begin CPR - Cycles of 30 CHEST COMPRESSIONS then 2 BREATHS (30:2)
• Perform continuous chest compressions until BVM is available
• Use BVM when available to give breaths even without O₂. Attach O₂ at 15L/min when available

AED/Defibrillator ARRIVES
Attach AED Pads or use Defibrillator Paddles to check the rhythm

Yes, shockable
Rhythm Shockable?

Asystole/PEA

No, nonshockable

VF/Pulseless VT

Shock
• Biphasic 200J (or as recommended by manufacturer)
• Monophasic 360J

Change Chest Compressors - CPR 2min
• IV/IO access – Take bloods for VBG & RBS
• Attach monitor leads; adjust monitor to lead II

High-Quality CPR
• Compress the centre of the chest with 2 hands at a rate of at least 100-120/min
• Compress to a depth of at least 5-6 cm
• Allow complete chest recoil after each compression
• Minimize interruptions in chest compressions to < 10 seconds
• Avoid excessive ventilation – Give enough volume just to produce visible chest rise. Give 2 breaths after every 30 compressions or if intubated, give 1 breath every 6 seconds

No Pulse

Consider advanced airway, capnography

Identify and Treat the reversible causes below

Reversible causes

• Hypoglycaemia
• Hypovolaemia
• Hypoxia
• Hydrogen ion (acidosis)
• Hyperglycaemia
• Hyperthermia
• Tension Pneumothorax
• Tamponade, cardiac
• Toxins
• Thrombosis, pulmonary
• Thrombosis, coronary

Yes, shockable

Rhythm Shockable?

No, nonshockable

VF/Pulseless VT

Shock
• Biphasic 200J (or as recommended by manufacturer)
• Monophasic 360J

Change Chest Compressors - CPR 2min
• IV/IO access – Take bloods for VBG & RBS
• Attach monitor leads; adjust monitor to lead II

Yes, shockable

Rhythm Shockable?

No, nonshockable

VF/Pulseless VT

Shock
• Biphasic 200J (or as recommended by manufacturer)
• Monophasic 360J

Change Chest Compressors - CPR 2min
• IV/IO access – Take bloods for VBG & RBS
• Attach monitor leads; adjust monitor to lead II

Yes, shockable

Rhythm Shockable?

No, nonshockable

VF/Pulseless VT

Shock
• Biphasic 200J (or as recommended by manufacturer)
• Monophasic 360J

Change Chest Compressors - CPR 2min
• IV/IO access – Take bloods for VBG & RBS
• Attach monitor leads; adjust monitor to lead II

Yes, shockable

Rhythm Shockable?

No, nonshockable

VF/Pulseless VT

Shock
• Biphasic 200J (or as recommended by manufacturer)
• Monophasic 360J

Change Chest Compressors - CPR 2min
• IV/IO access – Take bloods for VBG & RBS
• Attach monitor leads; adjust monitor to lead II

Yes, shockable

• Monophasic 360J

Change Chest Compressors - CPR 2min
• IV/IO access – Take bloods for VBG & RBS
• Attach monitor leads; adjust monitor to lead II
2. Post-Cardiac Arrest Care Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Return of Spontaneous Circulation (ROSC)

- Activate Resuscitation Team (if not already present)
- Monitor, support ABCs. Be prepared to provide CPR and defibrillation
- Check vital signs (BP, PR, RR, SPO2, T°C, RBS)

Optimize Ventilation and Oxygenation

- Avoid excessive ventilation.
  - Start at 10 – 12 breaths/min (1 breath every 6 seconds)
  - Titrate FiO2 to minimum necessary to maintain SPO2 ≥ 94%. DO NOT aim for 100%
  - Titrate to target PETCO2 of 35 – 45 mmHg
- Consider an advanced airway and waveform capnography

Treat Hypotension (SBP < 90mmHg)

- IV/IO Bolus (if not contraindicated e.g. pulmonary oedema, renal failure): 1-2 L Ringer’s Lactate/Hartmann’s Solution
- Vasopressor infusion if NO response to fluid bolus or fluid bolus contraindicated:
  - Adrenaline IV Infusion: 0.1 – 0.5µg/kg/min (7-35µg/min in 70-kg adult)
  - Norepinephrine IV Infusion: 0.1 – 0.5µg/kg/min (7-35µg/min in 70-kg adult)
- Identify and Treat reversible causes
  - Hypoglycaemia
  - Hypovolemia
  - Hypoxia
  - Hydrogen ion (acidosis)
  - Hypo-/hyperkalaemia
  - Hypothermia
  - Tension Pneumothorax
  - Tamponade, cardiac
  - Toxins
  - Thrombosis, pulmonary
  - Thrombosis, coronary

- Get a 12-lead ECG immediately. If STEMI or Suspected Cardiac Cause of cardiac arrest – Consult an Interventional Cardiologist
- If patient is stable, transfer to Critical Care Unit (ICU/CCU) attached to a defibrillator
- For patients who are comatose after cardiac arrest (i.e., lacking meaningful response to verbal commands), temperature should be monitored continuously, and fever should be treated aggressively with a target temperature between 32°C and 36°C maintained constantly for at least 24 hours.
3. Maternal Cardiac Arrest Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

**FIRST RESPONDER**
- Activate Resuscitation Team (if not already present) AND OBGYN
- Document time of onset of maternal cardiac arrest
- Place the patient supine and perform a left uterine displacement (LUD) with as below.
- Start resuscitation as per the 1. Adult Cardiac Arrest Algorithm; place hands slightly higher on the sternum than usual

**SUBSEQUENT RESPONDERS**

**Maternal Interventions**
- Treat as per 1. Adult Cardiac Arrest Algorithm
- Do not delay defibrillation
- Give typical ACLS drugs and doses
- Ventilate with 100% oxygen
- Monitor wave form capnography and CPR quality
- Provide post-cardiac arrest care as appropriate. See 2. Post-Cardiac Arrest Care Algorithm

**Maternal Modifications**
- Start IV access above the diaphragm
- Assess for hypovolaemia and give fluid bolus when required
- Anticipate difficult airway; experienced provider preferred for advanced airway placement
- If patient receiving IV/I0 magnesium prearrest, stop magnesium and give IV/I0 calcium chloride 10mL in 10% solution, or calcium gluconate 30 mL in 10% solution
- Continue all maternal resuscitative interventions (CPR, positioning, defibrillation, drugs, and fluids) during and after caesarean section

**Obstetric Interventions for Patient with an Obviously Gravid Uterus***
- Perform manual uterine displacement (LUD) – displace uterus to the patient’s left to relieve aortocaval compression
- Remove both internal and external foetal monitors if present
- Obstetric and neonatal teams should immediately prepare for possible emergency caesarean section
- If no ROSC by 4 minutes of resuscitative efforts, consider performing immediate emergency caesarean section
- Aim for delivery within 5 minutes of onset of resuscitative efforts

*An obviously gravid uterus is a uterus that is deemed clinically to be sufficiently large to cause aortocaval compression

**Search for and Treat Possible Contributing Factors (BEAU-CHOPS)**
- Bleeding/DIC
- Embolism: coronary/pulmonary/amniotic fluid embolism
- Anaesthetic complications
- Uterine atony
- Cardiac disease (MI/ischaemia/aortic dissection cardiomyopathy)
- Hypertension/preeclampsia/eclampsia
- Other: differential diagnosis of standard ACLS guidelines
- Placenta abruption/previa
- Sepsis
Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

4. Neonatal Resuscitation Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

**The most important and effective action in neonatal resuscitation is ventilation of the baby’s lungs.**

Airway
- Put baby’s head in “sniffing” position
- Suction mouth, then nose
- Suction trachea if meconium-stained and NOT vigorous

Breathing
- Bag-valve-mask ventilation for apnea, gasping, or pulse <100 bpm
- Ventilate at rate of 40 to 60 breaths/minute
- Listen for rising heart rate, audible breath sounds
- Look for slight chest movement with each breath
- Use CO2 detector after intubation
- Attach a pulse oximeter

Circulation
- Start compressions if HR is <60 after 30 secs of effective ventilation
- Give 1 compressions: 1 breath every 2 seconds
- Compress one-third of the anterior-posterior diameter of the chest

Drugs
- Give epinephrine if HR is <60 after 45 to 60 seconds of compressions and ventilation
- Caution: epinephrine dosage is different for ET and IV routes

Corrective Steps
- M: Mask adjustment.
- R: Reposition airway.
- S: Suction mouth and nose.
- O: Open mouth.
- P: Pressure increase.
- A: Airway alternative.

Endotracheal intubation

*Note: Endotracheal dose may not result in effective plasma concentration of drug, so vascular access should be established as soon as possible. Drugs given endotracheally require higher dosing than when given IV.
5. Rapid Sequence Intubation/Airway Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

### Preparation

**MALE MESS**
- Mask
- Airways (oral and nasal)
- Laryngoscopes, Laryngeal Mask Airway (LMA)
- Endotracheal tubes – Adult Males 8F, Females 7.5F; Child >1 year (Age/4) + (4 uncuffed) or 3.5(cuffed)
- Monitoring (pulse oximetry, ECG, capnography), Magill Forceps
- Emergency drugs/trolley
- Self-inflating bag valve resuscitator;
- Suction, Stylet, Bougie
- Plentiful oxygen supply

### Identify Predictors of Difficult Intubation (LEMON)
- Look for external markers of difficulty of BVM and intubation
- Evaluate the 3-3-2 rule
- Mallampati score ≥ 3
- Obstruction/Obesity
- Reduced Neck Mobility

If a difficult airway is predicted, IMMEDIATELY consult a clinician experienced in airway management and intubation before proceeding.

### Pre-oxygenation

- Attach oxygen via nasal prongs. Turn up to MAXIMUM if patient is unconscious or after sedation. Keep this for the entire intubation process.
- Spontaneously breathing patient
  - Initiate Ventilation Algorithm
  - Secure tube at a
  - Position patient as below and allow at least 5 mins of spontaneous breathing with a tight-fitting non-rebreather facemask at MAXIMUM and continue until the patient stops breathing after sedation/paralysis. Avoid positive pressure ventilation if possible
- Patient not breathing or not breathing adequately – Use a Bag-Valve-Mask (BVM) with a reservoir and O2 at 15L/min to provide 1 breath every 6 seconds (synchronized to the patient’s breaths) until you can achieve and sustain the highest possible SpO₂

### Position the patient

- Ensure you have 360° access to the patient
  - Belt/Belly Height – Head at or just above belt/belly level
  - HoP up – Head of Patient up to Head of Bed
  - HoB up – Head of Bed up 30°; Reverse Trendelenburg in High BMI, Late Pregnancy, Spinal Immobilisation
- Face Plane parallel to Ceiling (or just 10° tilt back) & Ear level to Sternal Notch

### Paralysis with Induction

**Pharmacologic agents and dosages used for rapid sequence intubation**

### Pass the tube /Laryngeal Mask Airway (LMA)

Limit attempt to < 30 seconds. Proceed down the algorithm after 30 seconds

### Proof of Intubation/ LMA Insertion

**5 Point Auscultation – Epicardium, Bilateral Axillae, Bilateral Lung Bases**

- Waveform Capnography - Maintain CO₂ level at 35 - 45mmHg

### Successful

- Self-inflating bag valve resuscitator ventilation – 1 breath every 6s
- Secure tube at a depth of 3 x ET Tube size at the teeth/gums
- Check vital signs (BP, PR, RR, SPO₂, T°C, RBS)
- Connect patient to the ventilator. See 7. Guideline for Initiation of Mechanical Ventilation Algorithm
- Initiate postintubation analgesia and sedation
  - Morphine 0.1 – 0.4mg/kg/hr
  - Ketamine (anaesthetic and sedative) 0.05 – 0.4mg/kg/hr
  - Midazolam 0.02 – 0.1mg/kg/hr
  - Dexmedetomidine 0.2 – 0.7 µg/kg/hr
- Obtain portable x-ray to Confirm Depth of ET Tube NOT location

### Not Successful

- Resume BVM ventilation - 1 breath every 3 seconds
  **See 6. Failed Intubation Algorithm**
6. Failed Intubation Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

- **Direct Laryngoscopy and Intubation (D.L.)**
  - Failed
    - Resume BVM ventilation - 1 breath every 3 seconds
    - **CALL Anaesthetist immediately**

- **Able to ventilate with BVM?**
  - **No**
  - **Yes**
    - Resume BVM ventilation - 1 breath every 3 seconds
    - Reposition patient to align the airway (sniffing position)
    - **One more D.L. attempt. Limit attempt to < 30 seconds**

- **Proof of Intubation**
  - **5 Point Auscultation**
    - Epigastrium, Bilateral Axillae, Bilateral Bases
    - Waveform Capnography
    - Maintain CO₂ level at 35-45mmHg

- **Insert Laryngeal Mask Airway**
  - **Able to ventilate with BVM?**
    - **No**
    - Surgical Cricothyrotomy
    - **Yes**
      - **Maintain ventilation**
        - Advanced Airway Techniques e.g. video laryngoscopy
        - Consult an **Anaesthetist** for fibre optic intubation

- **Insert Laryngeal Mask Airway**
  - **Successful**
  - **Failed**

- **Self-inflating bag valve resuscitator ventilation – 1 breath every 6s**
- Secure tube at a **depth of 3 x ET Tube size at the teeth/gums**
- Check vital signs (BP, PR, RR, SPO₂, T°C, RBS)
- Connect patient to the ventilator. **See 7. Guideline for Initiation of Mechanical Ventilation Algorithm**
- Initiate **postintubation analgesia and sedation**
  - Dexmedetomidine 0.2 – 0.7 µg/kg/hr
  - Morphine 0.1 – 0.4mg/kg/hr
  - Midazolam 0.02 - 0.1mg/kg/hr
  - Ketamine (analgesic and sedative) 0.05 – 0.4mg/kg/hr
- Obtain portable CXR to **Confirm Depth of ET Tube NOT location**

7. Guidelines for Initiation of Mechanical Ventilation Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

*Consider non-invasive ventilation for Pulmonary Oedema, COPD, Pneumonia, ARDS, Preintubation oxygenation

---

Choose Familiar Mode
SIMV or PRVC
\( \text{FiO}_2 = 1.0^* \)
*after the patient is settled, wean this down to an \( \text{FiO}_2 \) of 0.4 or a \( \text{PaO}_2 \) of 60-80 mmHg (8-10.6kPa)

---

Obstructive lung disease e.g. Asthma, COPD

VT 5-6 ml/kg PBW
*for Pressure Control, titrate PIP to achieve an expired VT of 5-6 ml/kg PBW
*titrate to \( \text{PaO}_2 \) of 60-80 mmHg (8-10.6kPa)

PEEP 3-4 cmH₂O
Keep PIP + PEEP < 30 cm H₂O
Rate 6-8 bpm
*titrate to allow complete expiration

---

Other

VT 6-8 ml/kg PBW
*for Pressure Control, titrate PIP to achieve an expired VT of 8-10 ml/kg PBW

PEEP 5 cmH₂O
* titrate to \( \text{PaO}_2 \) of 60-80 mmHg (8-10.6kPa)
Keep PIP + PEEP < 30 cm H₂O
Rate – Start at Patient’s Preintubation RR (< 30bpm)
*i titrate to \( \text{PaO}_2 \) of 35 - 45 mmHg (4.7 - 6 kPa)

---

Restrictive lung disease e.g. ARDS

VT 6 ml/kg PBW
*for Pressure Control, titrate PIP to achieve an expired VT of 6 ml/kg PBW

PEEP 8-10 cmH₂O
* titrate to \( \text{PaO}_2 \) of 60-80 mmHg (8-10.6kPa)
Keep PIP + PEEP < 30 cm H₂O
Rate – Start at Patient’s Preintubation RR (< 30bpm)
*i titrate to \( \text{PaO}_2 \) of 35 - 45 mmHg (4.7 - 6 kPa)

---

Additional Settings
Pressure support – 8-10 cmH₂O
Inspiratory trigger – 2 cmH₂O below the set PEEP
i times – Adults 1 sec; Toddlers/Children 0.7 sec; Neonates 0.5 sec

---

Abbreviations: SIMV, Synchronised Intermittent Mandatory Ventilation; PRVC, Pressure Regulated Volume Control; VT, Tidal Volume; PBW, Predicted Body Weight; PEEP, Positive End Expiratory Pressure; PIP, Peak Inspiratory Pressure

---

The Crashing Intubated Patient (Peri-Arrest or Arrest):
DOPES then DOTTS: The first mnemonic is how to diagnose the problem and the second mnemonic is how to fix the problem:

Diagnosing the Problem:
D = Displaced Endotracheal Tube or Cuff
O = Obstructed Endotracheal Tube: Patient biting down, kink in the tube, mucus plug
P = Pneumothorax
E = Equipment Check: Follow the tubing from the ETT back to the ventilator and ensure everything is connected
S = Stacked Breaths: Auto-PEEP. Patient unable to get all the air out from their lungs before initiating the next breath. Inspiratory time is much shorter than expiratory time (I/E ratio is anywhere from 1 to 3 or 1 to 4)

Fixing the Problem (Once you commit to this, do every step even if you fix the problem with one of the earlier letters):
D = Disconnect the Patient from the Ventilator: This fixes stacked breaths by decreasing intra-thoracic pressure and improving venous return
O = \( \text{O}_2 \) 100% Bag Valve Mask: The provider should bag the patient not anyone else because this lets you get a sense of what the potential problem is. Look, Listen, and Feel

*Look: Watch the chest rise and fall, look at ETT and ensure it is the same level it was at when it was put in
*Listen: Air leaks from cuff rupture or cuff above the cords; Bilateral breath sounds; Prolonged expiratory phase
*Feel: Feel the pressure of pilot balloon of endotracheal tube, crepitus; How is the patient bagging (Hard to bag or too easy to bag)
T = Tube Position/Function: Suction catheter to ensure tube is patent; Can also use bougie if you don’t have suction catheter, but be gentle (If to aggressive can cause potential harms); Ensure the tube is at the same level it was at when it was put in

T = Tweak the Vent: Decrease respiratory rate, decrease tidal volume, decrease inspiratory time. Biggest bang for your buck is decreasing the respiratory rate. This may cause respiratory acidosis (permissive hypercapnia)
S = Sonography: You can diagnose things much faster than waiting for respiratory therapist to come to the bedside or waiting for stat portable chest x-ray to be done.
8. Anaphylaxis Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient's individual needs. Failure to comply with this pathway does not represent a breach of the standard.

A patient meets the definition of anaphylaxis when **ANY 1** of the following 3 criteria are fulfilled:

1. Acute onset of **mucocutaneous signs AND 1** of the following:
   - respiratory compromise (wheezing-bronchospasm, dyspnoea, stridor, hypoxemia),
   - hypotension (syncope), or
   - hypotonia.

2. Rapid onset of **2 of the following** after exposure to likely allergen:
   - mucocutaneous signs,
   - respiratory compromise,
   - hypotension, or
   - persistent gastrointestinal symptoms.

3. **Hypotension** after exposure to a known allergen.

Patients with **simple allergic reactions** who **DO NOT** meet the criteria for anaphylaxis may be managed similarly **WITHOUT** the use of adrenaline.

---

**Features of Anaphylaxis**

**CAREFULLY REMOVE ALLERGEN IF STILL PRESENT** e.g. Bee sting

---

**Adrenaline**

(1mg/ml 1:1000)

0.3 ml IM anterolateral thigh (all age groups)

Repeat every 5-15 minutes if no improvement

---

**Antihistamines**

- **H1 Receptor Blockers**
  - e.g. Chlorpheniramine 10-20mg IM/IV
- **H2 Receptor Blockers**
  - e.g. Ranitidine 50mg IM/Slow IV

**IV Fluids**

- **(e.g. Ringer’s Lactate/Hartmann’s Solution)**
  - Rapid infusion of 20ml/kg if no response to Adrenaline
  - Repeat IV infusions as necessary as large amounts may be required
  - **Adrenaline infusion 0.1-0.5µg/kg/min** **ONLY** if unresponsive to IM Adrenaline and fluids

**Steroids**

- **Hydrocortisone 200mg**
  - IM/Slow IV

---

Patients with suspected anaphylaxis should be observed for **at least 6 hours**. Patients who are **NOT HIGH-RISK** should be discharged in the care of others. Before discharge from the hospital, all patients with anaphylactic reactions **must be**;

- Given clear indications for immediate return to the emergency department (ED).
- Considered for treatment with **antihistamines** and **oral steroids** for **3 days** to decrease the chance of further reaction.
9. Acute Asthma Exacerbation Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Acute Asthmatic Attack

- Monitor, support ABCs
- Start Oxygen if SPO₂ < 92%. Maintain SPO₂ ≥ 92%; Oxygen should be provided to all patients with severe asthma, even those with normal oxygenation.
- Perform brief, targeted history, physical exam (auscultation, use of accessory muscles, PR, RR)
- Initiate treatment of underlying cause of exacerbation
- Check Peak Expiratory Flow (PEF) as per PEF Chart below and record predicted or best PEF (%) in patient’s clinical notes. DO NOT measure PEF in patients with impending/actual respiratory arrest, drowsiness, confusion or silent chest. Start treatment immediately.

PEF > 50 % predicted or best

- Nebulise* with Salbutamol + Ipratropium bromide (doses below) every 20 mins or 3 doses for 1 hour. A combination of 4 mL volume fill with NS and 6 to 8L/min oxygen flow rate is recommended.
- Give Oral (if patient can swallow) or IV systemic corticosteroids (dose below) immediately

PEF ≤ 50 % predicted or best

- Nebulise* with Salbutamol + Ipratropium bromide (doses below) every 20 mins or 3 doses for 1 hour. A combination of 4 mL volume fill with NS and 6 to 8L/min oxygen flow rate is recommended.
- Give IV Hydrocortisone 2mg/kg (maximum 200mg) immediately

Reassess Hourly (or after every 3 doses)
Symptoms, physical exam + BP, PR, RR, SpO₂, PEF

Continuing clinical deterioration

Continuing Clinical Deterioration, Drowsiness, Confusion, or Silent Chest?

- Give high-dose IV Magnesium, 2gm in 5% Dextrose over 20-min
- Consider intubation (RSI with Ketamine if no C/I) and ventilation with 100% oxygen; anticipate cardiovascular collapse post-intubation
- Get CXR
- Nebulise* with Salbutamol + Ipratropium bromide (doses below) every 20 mins or 3 doses for 1 hour. A combination of 4 mL volume fill with NS and 6 to 8L/min oxygen flow rate is recommended.
- Give IV Hydrocortisone 2mg/kg (maximum 200mg) immediately
- Admit to HDU/ICU

PEF > 60-80% of predicted or personal best

- No Distress
- Physical Exam – Normal
- Response sustained 60 minutes after last treatment

Discharge Home

- Continue treatment with inhaled SABA – 2 puffs QID for 3-5 days
- Give oral systemic corticosteroids: Dexamethasone 0.6mg/kg or 12mg for adults as a single dose or Prednisone (see dose in table below)
- Review medication including inhaler technique
- Consider therapy for underlying cause of exacerbation
- Refer to Chest Physician for follow-up
How to Measure Peak Expiratory Flows (PEF)

**DO NOT** measure PEF in patients with impending/actual respiratory arrest, drowsiness, confusion or silent chest. Start treatment immediately.

1. Put the pointer on the gauge of the peak flow meter to 0 or the lowest number on the meter.
2. Attach the mouthpiece to the peak flow meter.
3. While standing, take a deep breath.
4. Put the peak flow meter mouthpiece in your mouth and close your lips tightly around the outside of the mouthpiece. Don’t put your tongue inside the mouthpiece.
5. Breathe out as hard and as fast as you can for 1 or 2 seconds. A hard and fast breath usually produces a “huff” sound.
6. Check the number on the gauge and write it down.
7. Repeat the above 3 times and take the patient’s best PEF
8. Plot the best PEF on the normal values chart and calculate the percentage as below

<table>
<thead>
<tr>
<th>Measured PEF X 100%</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal PEF</td>
</tr>
</tbody>
</table>

9. Record the PEF in the patient’s clinical notes.
10. Epistaxis Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Wear PPE-
ASK THE PATIENT TO BLOW THEIR NOSE TO REMOVE ANY CLOTS & SPRAY THE NARES WITH OXYMETAZOLINE SPRAY

Have the patient squeeze the distal alae while sitting up, bent forward at the waist over a vomit bucket, and expectorating blood for 15mins. USE A WATCH!! Ask the patient NOT to swallow any blood. A clamping device constructed of four tongue blades secured together by 1-inch tape over the distal alae can be used to clamp the nose closed.

- Monitor, support ABCs
- Check vital signs (BP, PR, RR, SPO₂, T°C)
- Perform brief, targeted history, physical exam
  - Nasal trauma from nose picking/blowing is the most common cause of epistaxis.
  - Hypertension DOES NOT cause epistaxis but may prolong it. Therapy should focus on control of the haemorrhage rather than reduction of the blood pressure. DO NOT PRESCRIBE ANTI-HYPERTENSIVE THERAPY FOR EPISTAXIS.
- DO NOT order lab investigations routinely
- For patients with severe or recurrent haemorrhage with a lot of clots, throwing up blood, or with unstable vital signs or underlying medical conditions, a FBC should be performed, as well as a type and screen.

**Epistaxis Algorithm**

**Yes**

- Repeat vital signs (BP, PR, RR, SPO₂, T°C)
- Remove any cotton pledges and observe the patient for bleeding for at least an hour after control. Encourage the patient to walk or perform other activities that he or she will need to resume when returning home.
- Patients with underlying medication use (aspirin, NSAIDS, warfarin) or renal or hepatic dysfunction, order FBC, UEC & ?LFTs and coagulation studies - consult an ENT Surgeon/Physician
  - If cause identified to be from nasal picking/blowing with no underlying medication use (aspirin, NSAIDS, warfarin) or renal or hepatic dysfunction, discharge patient (with ENT follow-up if recurrent).
  - Follow-up instructions - Vaseline or a similar moisturizing agent should be applied liberally in the nose TID for 7-10 days to promote healing of friable mucosa and superficial vessels.

**No**

- Insert a 15-cm piece of cotton pledge soaked in Adrenaline 1 mg + 5 mL Lignocaine 1% in the bleeding nostril for 10 mins. USE A WATCH!!

**Yes**

- Pack the bleeding nostril with a nasal tampon or a bacitracin ointment-soaked gauze (watch video http://bit.ly/2aTpWfa)
  - The tampon should be coated with bacitracin ointment or xylocaine jelly to facilitate placement.

**No**

- Insert a 15-cm piece of cotton pledge soaked in injectable form of Tranexamic acid (500 mg in 5 mL) in the bleeding nostril for 10 mins. USE A WATCH!!

**Yes**

- Pack the contralateral naris with a nasal tampon or a bacitracin ointment-soaked gauze to provide a counterforce to promote tamponade

**No**

- Do NOT remove the contralateral nasal pack.
  - Insert a lubricated foley catheter (size 12 or 14 F) until the tip and balloon is entirely in the nasopharynx. Fill the balloon with sterile water (usually 5-10cc) to allow it to be pulled snugly against the posterior nasal choana with anterior traction. The Foley is secured by placing an umbilical or c-clamp on the catheter at the level of the nasal ala with padding in between to prevent pressure injury.

**Yes**

- While the Foley is still in-situ, pack the nostril of the bleeding side using a nasal tampon or a bacitracin ointment-soaked gauze.
  - The tampon should be coated with bacitracin ointment or KY-Jelly to facilitate placement.

**No**
Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) “view” the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

11. Chest Pain (Acute Coronary Syndrome) Algorithm

Chest Discomfort Suggestive of Ischemia
(includes anginal equivalents (atypical symptoms) like exertional pain in the ear, jaw, neck, shoulder, arm, back, or epigastric area; exertional dyspnoea; nausea and vomiting; diaphoresis; and fatigue.

- Monitor, support ABCs in the Resuscitation Room (ER). Be prepared to provide CPR, Defibrillation and Thrombolysis/Fibrinolysis
- Obtain/review 12-lead ECG within 10 minutes of arrival to ED
  - Do a V4R if ST elevation in lead V1 with simultaneous ST depression in V2 - Right sided STEMI
  - Do V7 - V9 if ST depressions ≥ 1 mm with upright T-waves in ≥ 2 contiguous anterior precordial leads (V1 to V3) - Posterior STEMI
  - If there is ST elevation in aVR ≥ 1mm and aVR ≥ V1 with widespread horizontal ST depression, most prominent in leads I, II and V4-6 – consult an Interventional Cardiologist immediately for PCI (Left main coronary artery occlusion/Proximal LAD lesion/Severe sub endocardial ischaemia, nonlocalized)
  - Sinus Tachycardia, T wave inversion in III & V1, V3 or (S1, Q3, T3) pattern - See 15. Pulmonary Embolism Algorithm

- Check vital signs (BP, PR, RR, SPO2, T°C, RBS)
- Start Oxygen IF SPO2 < 90% or if patient is dyspnoeic. Maintain SPO2 ≥ 90%
- Perform brief, targeted history, physical exam – Indicate time of symptoms onset

- Consider other life-threatening causes of chest pain (pulmonary embolus, cardiac tamponade, aortic dissection, tension pneumothorax, oesophageal rupture)
- Review initial 12-lead ECG

Sequence of ECG changes seen during evolution of myocardial infarction - In the early stages of acute myocardial infarction the electrocardiogram may be normal or near normal; < ½ of patients with acute myocardial infarction have clear diagnostic changes on their first trace. About 10% of patients with a proved acute myocardial infarction (on the basis of clinical history and enzymatic markers) fail to develop ST segment elevation or depression. In most cases, however, serial electrocardiograms show evolving changes that tend to follow well recognised patterns.

11. Chest Pain (Acute Coronary Syndrome) Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.
12. STEMI Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

**ST-Elevation MI (STEMI)**

- Attach the patient to a DEFIBRILLATOR
- Establish IV access in left forearm or antecubital vein and send blood samples for UEC, hSTrOpinin T
- Aspirin 300mg to chew (if not given by EMS, not allergic, no active upper GI bleeding or retinal bleeding, not a haemophiliac)
- Nitroglycerin sublingual spray 0.4-Ang SL for pain relief every 5mins up to relief of discomfort or total of 5 doses reached. DO NOT give nitroglycerin if:
  - SBP < 90mmHg (or met the patient’s known baseline),
  - Heart rate > 100 bpm, or < 50 bpm.
  - Right ventricular infarction (right ventricular infarction causes a preload dependent state)
  - Use of alderafl or vardenafli within the previous 24 hours or tadafali within the previous 48 hours.
- Fentanyl 50ug IV if pain is NOT relieved by the 3 doses of SL nitroglycerin. Repeat once if still in pain after 5 mins. For persistent pain, consult a Cardiologist/Physician. Consider IV Nitroglycerin (see C/I above)

**Absolute Contraindications**
- Any prior intracranial haemorrhage
- Known structural cerebral vascular lesion (e.g., AVM)
- Known malignant intracranial neoplasm (primary or metastatic)
- Ischaemic stroke within 6 months EXCEPT acute ischaemic stroke within 4.5 hours
- Suspected aortic dissection
- Active bleeding or bleeding diathesis (excluding menses)
- Significant closed-head trauma or facial trauma within 1 month
- Intracranial or intraspinal surgery within 1 month
- Severe uncontrolled hypertension (unresponsive to emergency therapy)
- For streptokinase, prior treatment with streptokinase within the previous 6 months
- Non-compressible vascular punctures in the past 24 hrs

**Relative Contraindications**
- Severe hypertension on presentation (SBP > 180 mmHg or DBP > 110 mmHg)
- Lower BP first before fibrinolysis
- History of TIA in the preceding 6 months
- Traumatic or prolonged (>10 minutes) CPR
- Major surgery (<3 weeks)
- Recent (within 2 to 4 weeks) internal bleeding
- Pregnancy or within 1 week post-partum
- Active peptic ulcer
- Oral anticoagulant therapy

**No contraindications for Thrombolysis/Fibrinolysis**

- Ensure patient is connected to a defibrillator [ECG, SPO2, BP] and repeat baseline vitals.
- Administer fibrinolysis/thrombolysis within 10 mins of STEMI diagnosis

<table>
<thead>

<td>Bolus 15 mg IV, then give infusion of 0.75 mg/kg for 30 min (maximum 50 mg), then 0.5 mg/kg (maximum 35 mg) over the next 60 min; total dose not to exceed 100 mg.</td>
<td>+ +</td>
<td>No</td>
<td>73% to 84%</td>
</tr>
</tbody>
</table>

| Non-fibrin-specific: | Streptokinase | Set up second IV line for the Streptokinase. The adult dose of streptokinase for STEMI is 1.5 Million U in 50 mL of 5% dextrose in water (D5W) given IV over 30-60 minutes. Allergic reactions force the termination of many infusions before a therapeutic dose can be administered. Run Ringer’s Lactate/Martmann’s Solution TKVD in other line | No | Yes | 60% to 68% |

*Strength of fibrin specificity: " + + + " is more strong, " + + " is less strong.
**Streptokinase is highly antigenic and absolutely contraindicated within 6 mo of previous exposure because of the potential for serious allergic reaction.

IV indicates intravenous; IPA, reteplase plasminogen activator; TIMI, Thrombolysis In Myocardial Infarction; TMK-IPA, tenecteplase tissue-type plasminogen activator; and IPA, tissue-type plasminogen activator.

- Monitor vital signs (BP, PR, RR, SPO2) every 15 minutes during the infusions
- Continue monitoring patient for 30mins after the end of the infusions
- Transfer patient to CCU/ICU CONNECTED TO A DEFIBRILLATOR
13. NSTEMI/Unstable Angina Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

**NSTEMI/Unstable Angina Algorithm**

- **ST depression > 0.5mm or dynamic T-wave inversion ≥ 2mm**
  - High-Risk Unstable Angina/Non-ST-Elevation MI (UA/NSTEMI)

- **Normal or Non-diagnostic changes in ST segment or T wave**
  - Intermediate/Low Risk UA

---

- **Establish IV access and send blood samples for UEC, & hsTroponin T** *(obtain hsTroponin T at least 4 hours after symptom onset, not before)*
- **Aspirin 300mg** to chew (if not given by EMS, not allergic, no active upper GI bleeding or retinal bleeding, not a haemophiliac)
- **Nitroglycerin sublingual spray 0.4mg SL** for pain relief *every 5mins* up to relief of discomfort or *MAX 3 doses* reached. **DO NOT** give nitroglycerin if:
  - SBP < 90mmHg (or 30 mm Hg below the patient’s known baseline),
  - Heart rate > 100 bpm, or < 50 bpm.
  - Right ventricular infarction (right ventricular infarction causes a preload dependent state)
  - Use of sildenafil or vardenafil within the previous 24 hours or tadalafil within the previous 48 hours.
- **Fentanyl 50µg IV** if pain is **NOT** relieved by the 3 doses of SL nitroglycerin. Repeat **once** if still in pain after 5 mins. For persistent pain, consult a Cardiologist/Physician. Consider IVI nitroglycerin (see C/I above)
- **Consider CXR**

---

- Repeat 12 lead ECG in **30 mins**/Continuous ST-segment monitoring
- **See 12. STEMI Algorithm**

---

**Criteria for Discharge** (must meet ALL the criteria)

- Two ECGs which are Normal and No ST Depression and No Dynamic changes
- hsTroponin T < 14ng/L at ≥ 4 hours from onset of symptoms OR 3 hours from admission to ER

---

**EMERGENCY MEDICINE KENYA FOUNDATION**

emergencymedicinekenya.org
14. Adult Bradycardia (<50/min)/Tachycardia (>150/min) (with Pulse)

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Adult Bradycardia (<50/min)/Tachycardia (>150/min) (with Pulse)

- Airway
  - Open and maintain patent airway; protect as necessary

- Breathing
  - Administer Oxygen (if SPO2 < 94%); Assist breathing as necessary

- Circulation
  - Cardiac monitor to identify rhythm; monitor blood pressure, pulse oximetry, T°C, RBS
  - Establish IV access and take bloods for UEC, VBG
  - Print rhythm strip or 12-lead ECG if available; don’t delay therapy

Identify and Treat underlying cause
- Hypoglycaemia
- Hypovolaemia
- Hypoxia
- Hydrogen ion (acidosis)
- Hypo/hyperkalaemia
- Hypothermia
- Tension Pneumothorax
- Tamponade, cardiac
- Toxins
- Thrombosis, pulmonary
- Thrombosis, coronary

Brady Cardiac (HR < 50/min)
Consult a Cardiologist and continue with the algorithm

Tachycardia (>150/min)

- Stable
  - Signs of instability
    - Hypotension?
    - Acutely altered mental status?
    - Signs of Shock?
    - Ischaemic chest discomfort?
    - Acute heart failure?

Narrow Complex Tachycardia
(Supraventricular Tachycardia)
HR > 150/min + QRS complexes < 0.12 sec

- IV Atropine
  - Exclude: head injury, hypoxia, hypothermia, heart block, hyperkalaemia, heart transplant
  - First Dose: 0.5mg bolus
  - Repeat every 3-5 minutes
  - Maximum: 3 mg

- Vagal Stimulation
  - (try at least 2 different manoeuvres twice)
  - NOT if varying R-R intervals/Atrial fibrillation
  - Valsalva (Abdominal pressure/Breath holding)
  - Modified Valsalva manoeuvre
  - Carotid sinus massage (C/I if bruises, CVS disease, elderly)

- Adenosine
  - NOT if varying R-R intervals/Atrial fibrillation
  - 6 mg rapid IV push; follow with 20mls NS flush; then 12 mg IV after 1-2 mins if required
  - Consult a Cardiologist

- Synchronised Cardioversion
  - Consider procedural sedation
  - Start with 100J initially escalating by 50J for subsequent shocks until cardioversion.
  - Consult a Cardiologist

- Amiodarone
  - 150mg IV over 10 mins then 1mg/min infusion for first 6 hours

Wide QRS
≥ 0.12 seconds

Wide Complex Tachycardia
(Ventricular Tachycardia)
HR > 150/min + QRS complexes ≥ 0.12 sec

Any signs of instability
- Hypo/hyperkalaemia
- Hypoglycaemia
- Hypovolaemia
- Hypoxia
- Hydrogen ion (acidosis)
- Hypothermia
- Hypersensitivity
- Tension Pneumothorax
- Tamponade, cardiac
- Toxins
- Thrombosis, pulmonary
- Thrombosis, coronary

- Adenosine
  - NOT if varying R-R intervals/Polyphormic
  - 6 mg rapid IV push; follow with 20mls NS flush; then 12 mg IV after 1-2 mins if required
  - Consult a Cardiologist

- Amiodarone
  - 150mg IV over 10 mins then 1mg/min infusion for first 6 hours

Alternatives (under expert advice)
- β-blockers
- Ca-Channel Blockers or
- Digoxin

Consider (if Torsades de Pointes):
- Defibrillation (asynchronous)
- Magnesium 2gm IV over 10 mins
- Overdrive pacing
Transcutaneous Pacing Procedure

1. See 14. Adult Bradycardia (< 50/min)/Tachycardia (> 150/min) (with Pulse) for indications. Inotropes may be used if transcutaneous pacing is NOT available. See 14. Adult Bradycardia (< 50/min)/Tachycardia (> 150/min) (with Pulse)
2. Place the pacing pads on the chest of the patient as per package instructions
3. Connect the pads cable to the pacing machine if not already connected
4. Turn the pacer ON. Observe for markers (*) indicating the R-wave on the screen. Some machines require that you START pacing after turning the pacer on. Observe for pacing spikes (||) on the baseline.
5. Set the Rate to approximately 60-70 bpm.
6. Set current milliamperes (mA) output as follows: Increase milliamperes (mA) from minimum setting until every pacer spike is immediately followed by a wide QRS and a broad T wave – This is termed as Electrical Capture.
7. Confirm by checking the patient’s femoral pulse to see if the pulse rate matches the rate set above i.e. 60-70bpm. This is termed as Mechanical Capture.
8. Recheck the patient’s vital signs and confirm the patient’s signs of shock are resolving i.e. increase in blood pressure, improved mentation, etc. This is termed as Physiological Capture.
9. If all the above is achieved, increase the current milliamperes by 10% for safety margin
10. Provide adequate sedation and analgesia if the patient experiences any discomfort
11. Transfer care to a Cardiologist without delay. DO NOT STOP PACING unless instructed to by a Cardiologist.

Trouble Shooting

- Pacing Spikes not seen on the base line – Confirm that you have pressed the START button
- No Electrical Capture – Confirm that the pads are firmly pressed on the patient’s chest. Continue increasing the milliamperes. There is no set minimum or maximum.
- No Mechanical Capture – Increase the milliamperes by increments of 5-10mA and recheck the pulse
- No Physiological Capture – Consider hypovolaemia as the cause of shock and give a small fluid bolus (250-500mls) and recheck the patient. If not, increase the set rate to 80bpm, confirm electrical capture and mechanical capture and recheck the patient
- In all cases, consult a Cardiologist.
15. Pulmonary Embolism Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient's individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Clinical features suggestive of Pulmonary Embolism

- Monitor, support ABCs in Resuscitation room (ER). Be prepared to provide CPR, Defibrillation and Thrombolysis.
- Obtain/review 12-lead ECG – Consider ACS – See 12. STEMI Algorithm
- Features of PE on ECG: Sinus Tachycardia, T wave inversion in III & V1, V3 or S1, Q3, T3 pattern. A normal ECG can be seen in 30% of patients
- Check vital signs (BP, PR, RR, SPO2, T, RBS)
- Start Oxygen IF SPO2 < 94% or if patient is dyspnoeic. Maintain SPO2 ≥ 94%
- Establish IV Access and send blood samples for FBC, UEC, VBG, Coagulation screen & hsTroponin T (See 13. NSTEMI/UA Algorithm for interpretation)
- Perform brief, targeted history, physical exam

Pulmonary Embolism Rule-Out Criteria (PERC) (available in MDCalc)

1. Is the patient > 49 years of age?
2. Is the pulse rate > 99 beats per minute?
3. Is the pulse oximetry reading < 95% while the patient breathes room air?
4. Is there a present history of haemoptysis?
5. Is the patient receiving exogenous oestrogen?
6. Does the patient have a prior diagnosis of venous thromboembolism?
7. Has the patient had recent surgery or trauma requiring endotracheal intubation or hospitalization in the previous 4 weeks?
8. Does the patient have unilateral leg swelling (visual observation of asymmetry of the calves)?

Any of the above criteria present?

Haemodynamically stable, Low Probability for PE

Moderate to High Probability for PE

Shock or Hypotension?

Bedside Echocardiogram

Presence of RV dilatation, septal shift, or right heart thrombus?

Yes

No

CTPA*

Negative

Positive

Yes

No

Admit to ICU or floor as indicated

Negative

Begin anticoagulation therapy

Consult a Physician

Admit to ICU or floor as indicated

Begin anticoagulation therapy

1Indications for Thrombolysis in PE (rule out contraindication to Thrombolysis)

- Cardiac Arrest
- SBP <90 mmHg for >15 minutes, if not caused by new-onset arrhythmia, hypovolaemia, or sepsis

Streptokinase 250 000 IU over 30 minutes then 100 000 IU/h over 12–24 hours. Accelerated regimen: 1.5 million IU over 2 hours

Alteplase 100 mg over 2 hours; or Cardiac Arrest: 50mg IV bolus

* Compression ultrasound of lower extremities can be performed as the initial diagnostic imaging modality in any of the following situations;
- patients with obvious signs of deep vein thrombosis (DVT) for whom venous ultrasound is readily available
- patients with relative contraindications for CT scan (e.g., borderline renal insufficiency, CT contrast agent allergy)
- in pregnant patients
- patients with a moderate to high clinical risk of PE with a negative or inconclusive CTPA or an inconclusive V/Q scan.

A positive finding in a patient with symptoms consistent with PE can be considered evidence for diagnosis of VTE disease and potentially eliminate the need to expose the patient to the radiation from either a CTPA or V/Q scan.

emergencymedicinekenya.org
Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) “view” the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

16. Hypertension Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

BP > 130/80mmHg

- Monitor, support ABCs
- Check vital signs (BP, PR, RR, SPO₂, T°C, RBS)
- Start Oxygen if SPO₂ < 94%. Maintain SPO₂ ≥ 94%
- Perform brief, targeted history and physical exam
- Obtain/review 12-lead ECG (if indicated)
- Send samples for FBC, UEC, TSH and Urinalysis (for proteinuria) and PDT (as applicable)
- **DO NOT ADMINISTER ORAL ANTIHYPERTENSIVES** (e.g. nifedipine) TO LOWER THE BLOOD PRESSURE IN THE ED.
- Allow patient to rest awaiting results. Repeat BP checks hourly.

Are there any features of progressive or impending end organ damage (especially if BP > 180/110 mmHg)?

a) Neurological
- Cerebral vascular accident/cerebral infarction
- Hypertensive encephalopathy
- Subarachnoid haemorrhage
- Intracranial haemorrhage

b) Cardiovascular
- Acute pulmonary oedema
- Congestive heart failure
- Myocardial ischemia/infarction
- Acute left ventricular dysfunction
- Aortic dissection

c) Other
- Acute renal failure/insufficiency
- Retinopathy
- Pre-eclampsia/Eclampsia
- Micro angiopathic haemolytic anaemia

Headache/Epistaxis is **NOT** a hypertensive emergency, no matter how high the blood pressure. It is likely the headache/epistaxis is causing the hypertension, not the other way around. Treat the headache/epistaxis and the pressure will come down.

Known Hypertensive – Resume regular treatment; if unknown, low dose thiazide type diuretic for most; may consider ACE inhibitor, ARB, β-blocker, CCB. Follow-up as below (see Guidelines for prevention, detection, evaluation and management of high blood pressure in adults)

New Onset Hypertension - Final BP prior to discharge
- **BP > 160/100** – low dose thiazide type diuretic for most; may consider ACE inhibitor, ARB, β-blocker, CCB. (see Guidelines for prevention, detection, evaluation and management of high blood pressure in adults ). Follow-up as below
- **BP < 160/100** – Follow-up as below

Daily BP checks at nearest clinic and follow-up in a Medical Clinic in 1 week with BP chart

See 17. Hypertensive Emergencies Algorithm
Guideline for the Prevention, Detection, Evaluation, and Management of High Blood Pressure in Adults

**BLOOD PRESSURE MEASUREMENT TECHNIQUES**

1. Have the patient relax, sitting in a chair (feet on floor, back supported) for >5 min.
2. The patient should avoid caffeine, exercise, and smoking for at least 30 min before measurement.
3. Ensure patient has emptied his/her bladder.
4. Neither the patient nor the observer should talk during the rest period or during the measurement.
5. Remove all clothing covering the location of cuff placement.
6. Measurements made while the patient is sitting or lying on an examining table do not fulfill these criteria.
7. Use a BP measurement device that has been validated and ensure that the device is calibrated periodically. *
8. Support the patient’s arm (e.g., resting on a desk).
9. Position the middle of the cuff on the patient’s upper arm at the level of the right atrium (the midpoint of the sternum).
10. Use the correct cuff size, such that the bladder encircles 80% of the arm, and note if a larger- or smaller-than-normal cuff size is used.
11. Either the stethoscope diaphragm or bell may be used for auscultatory readings.
12. At the first visit, record BP in both arms. Use the arm that gives the higher reading for subsequent readings.
13. Separate repeated measurements by 1–2 min.
14. For auscultatory determinations, use a palpated estimate of radial pulse obliteration pressure to estimate SBP. Inflate the cuff 20–30 mm Hg above this level for an auscultatory determination of the BP level.
15. For auscultatory readings, deflate the cuff pressure 2 mm Hg per second, and listen for Korotkoff sounds.
16. Record SBP and DBP. If using the auscultatory technique, record SBP and DBP as onset of the first Korotkoﬀ sound and disappearance of all Korotkoﬀ sounds, respectively, using the nearest even number.
17. Note the time of most recent BP medication taken before measurements.
18. Use an average of ≥ 2 readings obtained on ≥2 occasions to estimate the individual’s level of BP.
19. Provide patients the SBP/DBP readings both verbally and in writing.

### Categories of BP in Adults*

**DIAGNOSTIC WORKUP OF HYPERTENSION**

- Assess risk factors and comorbidities
- Reveal identifiable causes of hypertension
- Assess presence of target organ damage
- Conduct history and physical examination
- Obtain/review 12-lead ECG, RBS, FBC, UEC, TSH, Urinalysis for proteinuria, Lipid profile
Introduction
Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG
The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Blood Pressure (BP) Thresholds and Recommendations for Treatment and Follow-Up

* Using the ACC/AHA Pooled Cohort Equations. Note that patients with DM or CKD are automatically placed in the high-risk category. For initiation of RAS inhibitor or diuretic therapy, assess blood tests for electrolytes and renal function 2 to 4 weeks after initiating therapy.

† Consider initiation of pharmacological therapy for stage 2 hypertension with 2 antihypertensive agents of different classes. Patients with stage 2 hypertension and BP ≥160/100 mm Hg should be promptly treated, carefully monitored, and subject to upward medication dose adjustment as necessary to control BP. Reassessment includes BP measurement, detection of orthostatic hypotension in selected patients (e.g., older or with postural symptoms), identification of white coat hypertension or a white coat effect, documentation of adherence, monitoring of the response to therapy, reinforcement of the importance of adherence, reinforcement of the importance of treatment, and assistance with treatment to achieve BP target.

* Calculate the 10-year risk for first atherosclerotic cardiovascular disease events (ASCVD; nonfatal myocardial infarction, coronary heart disease–related death, or fatal or nonfatal stroke) with the ASCVD Risk Calculator (available in MDCalc)

</tr>
</tbody>
</table>

Hypertensive Encephalopathy - Reduce mean arterial pressure (MAP) 25% over 8 hours.

Acute Ischemic Stroke - Evidence exists that patients who have acute strokes have better outcomes with higher BPs. Antihypertensive therapy is not routinely recommended for patients with acute stroke and HTN.

- Patient otherwise eligible for acute reperfusion therapy except that BP is >185/110 mm Hg:
  - Labetalol
  - Other agents (hydralazine, enalaprilat, etc.) may be considered when appropriate
- Management of BP during and after rtPA or other acute reperfusion therapy to maintain BP at or below 180/105 mm Hg:
  - Monitor BP every 15 minutes for 2 hours from the start of rtPA therapy, then every 30 minutes for 6 hours, and then every hour for 16 hours
  - If systolic BP >180–230 mm Hg or diastolic BP >105–120 mm Hg:
    - Labetalol
    - If BP not controlled or diastolic BP >140 mm Hg, consider IV sodium nitroprusside
- After treatment with fibrinolysis, the SBP should be maintained < 180mmHg and DBP < 105mmHg for 24 hours.

- In patients with markedly elevated blood pressure (SBP > 220 mm Hg or DBP > 120 mm Hg) who do not receive fibrinolysis, a reasonable goal is to lower blood pressure by 15% during the first 24 hours after onset of stroke.

Acute Intracerebral Haemorrhage - No evidence exists to suggest that HTN provokes further bleeding in patients with ICH. A precipitous fall in SBP may compromise cerebral perfusion and increase mortality. The controlled lowering of BP with IV labetalol (in the absence of bradycardia) is currently recommended only when the SBP is >200mmHg or the DBP is >110mmHg. Treatment based on clinical/radiographic evidence of increased intracranial pressure (ICP).

- If signs of increased ICP, maintain MAP just below 130mmHg (or SBP < 180mmHg) for first 24 hours after onset.
- Patients without increased ICP, maintain MAP < 110mmHg (or SBP < 160mmHg) for first 24 hours after symptom onset.

Subarachnoid Haemorrhage - Maintain SBP < 160mmHg until the aneurysm is treated or cerebral vasospasm occurs. Oral nimodipine is used to prevent delayed ischemic neurological deficits, but it is NOT indicated for treating acute hypertension.

Cardiovascular Emergencies

Aortic Dissection – Immediately reduce the SBP < 120mmHg and maintain it at this level unless signs of end-organ hypo perfusion are present. Preferred treatment includes a combination of:

a) narcotic analgesics (morphine sulphate),
b) vasodilators (nicardipine, nitropresside).
c) β-blockers (labetalol, esmolol) or calcium channel blockers (verapamil, diltiazem); Avoid β-blockers if there is;
  - aortic valvular regurgitation or
  - suspected cardiac tamponade.

Acute Coronary Syndrome - Treat if SBP >160 mmHg and/or DBP >100 mmHg. Reduce BP by 20-30% of baseline. Thrombolytics are contraindicated if BP is >185/100 mmHg. Preferred medications include β-blockers & Nitroglycerin.

Acute Heart Failure - Treatment with vasodilators (in addition to diuretics) for SBP ≥ 140 mmHg. IV or sublingual nitroglycerin is the preferred agent.

Other Disorders

Cocaine toxicity/Pheochromocytoma - Hypertension and tachycardia from cocaine toxicity rarely require specific treatment.

- Benzodiazepines are the preferred agents for cocaine-associated acute coronary syndromes.
- Pheochromocytoma treatment guidelines are similar to that of cocaine toxicity. β-blockers can be added for BP control only after α-blockade.

Preferred medications - Diazepam, Phentolamine, Nitroglycerin/nitropresside

Medications to avoid - β-adrenergic antagonists prior to phentolamine administration

Preeclampsia/eclampsia - In women with eclampsia or preeclampsia, SBP should be < 160 mmHg and DBP <110 mm Hg in the prepartum and intrapartum periods. If the platelet count is < 100,000 cells/mm³, the platelet count should be maintained below 150/100mmHg. Patients with eclampsia or preeclampsia should also be loaded with IV Magnesium sulphate 4g diluted in 100mL NS over 15 mins then with an infusion of 2gm/hr to avoid seizures.

Preferred medications - Hydralazine, Labetalol, Nifedipine

Medications to avoid - Nitropresside, Angiotensin-converting enzyme inhibitors, Esmolol
**Hypertensive Emergencies Drug Infusions**

*For adults with a compelling condition (i.e., aortic dissection, severe preeclampsia or eclampsia, or pheochromocytoma crisis), SBP should be reduced to < 140 mm Hg during the first hour and to < 120 mm Hg in aortic dissection. For adults without a compelling condition, SBP should be reduced by no more than 25% within the first hour; then, if stable, to 160/100 mm Hg within the next 2 to 6 hours; and then cautiously to normal during the following 24 to 48 hours.*

### Identify signs of Possible Acute Stroke

<table>
<thead>
<tr>
<th>Test</th>
<th>Findings</th>
</tr>
</thead>
</table>
| Facial Droop: Have patient show teeth or smile | Normal – both sides of face move equally  
Abnormal – one side of face does not move as well as the other |
| Arm Drift: Patient closes eyes and extends both arms straight out, with palms up, for 10 seconds | Normal – both arms move the same or both arms do not move at all  
Abnormal – one arm does not move, or one arm drifts down compared with the other |
| Abnormal Speech: Have the patient repeat a sentence | Normal – patient uses correct words with no slurring  
Abnormal – patient slurs words, uses the wrong words, or is unable to speak |

**Interpretation:** If any 1 of these 3 signs is abnormal, the probability of a stroke is 72%. The presence of ALL 3 findings indicates that the probability of stroke is >85%

- Monitor, support ABCs in the Resuscitation Room (ER)
- Check vital signs (BP, PR, RR, SPO₂, T° C).
- Start Oxygen IF SPO₂ < 94%. Maintain SPO₂ > 94%
- Check Glucose and treat if < 3.3mmol/L with 50mL 50% Dextrose bolus. Maintain blood glucose between 7.7-10mmol/L
- Establish 18G IV Access and send samples for FBC, UEC, Coagulation Screen
- Perform brief, targeted history, physical exam, NIH Stroke Scale; indicate time when patient last known normal

### Time from onset of symptoms*

*for patients who wake up with stroke symptoms, consider the time the patient went to sleep as the time of symptom onset

- **< 4.5 hours**
  - ER Doctor & Nurse MUST accompany patient to radiology IMMEDIATELY with Stroke Box (must include Stroke Reperfusion Protocol & Fibrinolytic) & Monitor
  - Obtain non-contrast enhanced Brain CT Scan within 20 minutes of patient arrival
    - No Haemorrhage
      - Consult a Neurologist & Neurosurgeon IMMEDIATELY and start the Stroke Reperfusion Protocol in Radiology
    - Haemorrhage
      - Consult a Neurosurgeon
  - No Haemorrhage
    - Give 300mg Aspirin
    - Admit Stroke Unit

- **≥ 4.5 hours - < 8 hours**
  - ER Doctor & Nurse MUST accompany patient to radiology IMMEDIATELY.
  - Obtain non-contrast enhanced Brain CT Scan & Cerebral Angiogram within 20 minutes of patient arrival
    - No Haemorrhage
      - Consult a Neurologist & Neurosurgeon IMMEDIATELY
    - Haemorrhage
      - Consult a Neurosurgeon

- **≥ 8 hours - < 24 hours**
  - ER Nurse MUST accompany patient to radiology & inform ER Doctor IMMEDIATELY
  - Obtain Brain MRI Limited Stroke Protocol within 20 minutes of patient arrival
    - No Haemorrhage
      - Consult a Neurologist & Neurosurgeon IMMEDIATELY
    - Haemorrhage
      - Consult a Neurosurgeon

- **≥ 24 hours**
  - Obtain non-contrast enhanced Brain CT Scan
    - No Haemorrhage
      - Give 300mg Aspirin
      - Admit Stroke Unit
    - Haemorrhage
      - Consult a Neurosurgeon
National Institutes of Health Stroke Scale (NIHSS)

(Available in MDCalc)

| 1a. Level of consciousness | 0 = Alert; keenly responsive  
| 1 = Not alert, but rousable by minor stimulation  
| 2 = Not alert; requires repeated stimulation  
| 3 = Unresponsive or responds only with reflex | 7. Limb ataxia | 0 = Absent  
| 1 = Present in one limb  
| 2 = Present in two limbs |

| b. Level of consciousness questions:  
| What is the month?  
| What is your age? | 8. Sensory | 0 = Normal; no sensory loss  
| 1 = Mild-to-moderate sensory loss  
| 2 = Severe to total sensory loss |

| c. Level of consciousness commands: | 0 = Performs both tasks correctly  
| 1 = Performs one task correctly  
| 2 = Performs neither task correctly | 9. Best language | 0 = No aphasia; normal  
| 1 = Mild to moderate aphasia  
| 2 = Severe aphasia  
| 3 = Mute, global aphasia |

| 2. Best gaze | 0 = Normal  
| 1 = Partial gaze palsy  
| 2 = Forced deviation | 10. Dysarthria | 0 = Normal  
| 1 = Mild to moderate dysarthria  
| 2 = Severe dysarthria |

| 3. Visual | 0 = No visual loss  
| 1 = Partial hemianopia  
| 2 = Complete hemianopia  
| 3 = Bilateral hemianopia | 11. Extinction and inattention | 0 = No abnormality  
| 1 = Visual, tactile, auditory, spatial, or personal inattention  
| 2 = Profound hemi-inattention or extinction |

| 4. Facial palsy | 0 = Normal symmetric movements  
| 1 = Minor paralysis  
| 2 = Partial paralysis  
| 3 = Complete paralysis of one or both sides |

| 5. Motor Arm  
| a. Left Arm (LA)  
| b. Right Arm (RA) | 6. Motor Leg  
| a. Left Leg (LL)  
| b. Right Leg (RL) | Total Score = 0 - 42 |

| 0 = No drift  
| 1 = Drift  
| 2 = Some effort against gravity  
| 3 = No effort against gravity; limb falls  
| 4 = No movement | LA | RA | LL | RL | Time | Total Score |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 |
| 3 | 3 | 3 | 3 | 3 | 3 | 3 | 3 |
| 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 |
Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as hypertensive emergencies. In normal subjects, the 12-lead electrocardiogram (ECG) provides a comprehensive view of the electrical activity of the heart and is used to assess cardiac function. The information from these 12 leads is combined to form a standard electrocardiogram.

### Inclusion and Exclusion Characteristics of Patients with Ischemic Stroke Who Could Be Treated With IV rtPA Within 3 Hours From Symptom Onset

#### Inclusion criteria
- Diagnosis of ischemic stroke causing measurable neurological deficit
- Onset of symptoms < 3 hours before beginning treatment
- Aged ≥18 years

#### Exclusion criteria
- Significant head trauma or prior stroke in the previous 3 months
- Symptoms suggest subarachnoid haemorrhage
- Arterial puncture at non-compressible site in previous 7 days
- Intracranial neoplasm, AVM, or aneurysm
- Recent intracranial or intraspinal surgery
- Elevated blood pressure (systolic >185 mmHg or diastolic >110 mmHg).
- Blood glucose concentration <50 mg/dL (2.7 mmol/L)
- Heparin received within 48 h resulting in abnormally elevated aPTT above the upper limit of normal.
- Coagulation test results but should be discontinued if INR is >1.7 or PT is >15 s
- Current use of anticoagulant with INR >1.7 or PT >15 s
- Recent intracranial or intraspinal surgery
- Elevated blood pressure (systolic >185 mmHg or diastolic >110 mmHg).
- Lower BP first before fibrinolysis
- Active internal bleeding
- Acute bleeding diathesis, including but not limited to
  - Platelet count <100,000/mm³
  - Heparin received within 48 h resulting in abnormally elevated aPTT above the upper limit of normal
  - Current use of anticoagulant with INR >1.7 or PT >15 s
  - Current use of direct thrombin inhibitors or direct factor Xa inhibitors with elevated sensitive laboratory tests (eg, aPTT, INR, platelet count, ECT, TT, or appropriate factor Xa activity assays)
- Blood glucose concentration <50 mg/dL (2.7 mmol/L)
- CT demonstrates multilobar infarction (hypodensity >1/3 cerebral hemisphere)
- Active internal bleeding
- Acute bleeding diathesis, including but not limited to
- Platelet count <100,000/mm³
- Heparin received within 48 h resulting in abnormally elevated aPTT above the upper limit of normal
- Current use of anticoagulant with INR >1.7 or PT >15 s
- Current use of direct thrombin inhibitors or direct factor Xa inhibitors with elevated sensitive laboratory tests (eg, aPTT, INR, platelet count, ECT, TT, or appropriate factor Xa activity assays)
- Blood glucose concentration <50 mg/dL (2.7 mmol/L)
- CT demonstrates multilobar infarction (hypodensity >1/3 cerebral hemisphere)

#### Relative exclusion criteria
- Recent intracranial or intraspinal surgery
- Seizure at onset with postictal residual neurological impairments
- Major surgery or serious trauma within previous 14 days
- Recent gastrointestinal or urinary tract haemorrhage (within previous 21 days)
- Recent acute myocardial infarction (within previous 3 months)
- Significant head trauma or prior stroke in the previous 3 months
- Symptoms suggest subarachnoid haemorrhage
- Arterial puncture at non-compressible site in previous 7 days
- Intracranial neoplasm, AVM, or aneurysm
- Recent intracranial or intraspinal surgery
- Elevated blood pressure (systolic >185 mmHg or diastolic >110 mmHg).
- Blood glucose concentration <50 mg/dL (2.7 mmol/L)
- Heparin received within 48 h resulting in abnormally elevated aPTT above the upper limit of normal.
- Coagulation test results but should be discontinued if INR is >1.7 or PT is >15 s
- Current use of anticoagulant with INR >1.7 or PT >15 s
- Recent intracranial or intraspinal surgery
- Elevated blood pressure (systolic >185 mmHg or diastolic >110 mmHg).
- Lower BP first before fibrinolysis
- Active internal bleeding
- Acute bleeding diathesis, including but not limited to
- Platelet count <100,000/mm³
- Heparin received within 48 h resulting in abnormally elevated aPTT above the upper limit of normal
- Current use of anticoagulant with INR >1.7 or PT >15 s
- Current use of direct thrombin inhibitors or direct factor Xa inhibitors with elevated sensitive laboratory tests (eg, aPTT, INR, platelet count, ECT, TT, or appropriate factor Xa activity assays)
- Blood glucose concentration <50 mg/dL (2.7 mmol/L)
- CT demonstrates multilobar infarction (hypodensity >1/3 cerebral hemisphere)

### Additional Inclusion and Exclusion Characteristics of Patients with Acute Ischemic Stroke Who Could Be Treated With IV rtPA within 3 to 4.5 Hours From Symptom Onset

#### Main inclusion criteria
- Diagnosis of ischemic stroke causing measurable neurologic deficit
- Onset of symptoms within 3 to 4.5 hours before beginning treatment

#### Exclusion criteria
- Age > 80 years
- Baseline NIHSS score >25
- Taking oral anticoagulant regardless of INR
- History of both diabetes and prior ischemic stroke
- Those with imaging evidence of ischemic injury involving more than one third of the middle cerebral artery territory,

### Notes
- A physician with expertise in acute stroke care may modify this list.
- Onset time is defined as either the witnessed onset of symptoms or the time last known normal if symptom onset was not witnessed.
- In patients without recent use of oral anticoagulants or heparin, treatment with IV rtPA can be initiated before availability of coagulation test results but should be discontinued if INR is >1.7 or PT is abnormally elevated by local laboratory standards.
- In patients without history of thrombocytopenia, treatment with IV rtPA can be initiated before availability of platelet count but should be discontinued if platelet count is <100,000/mm³.

### Review/Complete Fibrinolysis Checklist

1. **Monitor blood glucose and temperature and treat if indicated.**
2. **Maintain blood glucose between 7.7 mmol/L and 10 mmol/L.**
3. **Monitor blood pressure and perform neurological assessments every 15 minutes during and after IV rtPA infusion for 2 hours, then every 30 minutes for 6 hours, then hourly until 24 hours after IV rtPA treatment.**
4. **Admit to stroke unit.**

### Probable Acute Ischaemic Stroke

**BEGIN 18. STROKE ALGORITHM**

### Candidate

- Repeat NIH Stroke Scale: are deficits rapidly improving to normal?
- Patient remains candidate for fibrinolytic therapy?

#### Candidate

- Admit to stroke unit
- Administer aspirin 325 mg PO/PR
- In patients already taking statins, continue treatment
- Monitor blood glucose and temperature and treat if indicated. Maintain blood glucose between 7.7 mmol/L and 10 mmol/L
- Initiate supportive therapy; treat comorbidities

#### Not a Candidate

- Review risks/benefits with patient and family. If acceptable, obtain CONSENT FOR FIBRINOLYSIS
  - Ensure patient is attached to monitor (ECG, SPO2, BP) and repeat baseline vitals. Treat BP if indicated (See 17. Hypertensive Emergencies Algorithm)
  - Set up second IV line for the fibrinolysis. Run NS/RL TKVO in other line
  - ALTEPLASE (give within 60 minutes of patient arrival)
  - The recommended dose of alteplase is 0.9 mg/kg (maximum 90 mg) infused over 60 minutes, with 10% of the total dose administered as an initial IV bolus over 1 minute.
  - Measure blood pressure and perform neurological assessments every 15 minutes during and after IV rtPA infusion for 2 hours, then every 30 minutes for 6 hours, then hourly until 24 hours after IV rtPA treatment.
  - Admit to stroke unit
19. Transient Ischemic Attack (TIA) Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

The AHA/ASA has endorsed the current definition of TIA as “a transient episode of neurological dysfunction caused by focal brain, spinal cord, or retinal ischemia, without acute infarction.” The new definition of TIA completely eliminates the element of time and emphasizes neuroimaging instead.

### Mimics
- **Stoke**
- **Hypoglycaemia / hyperglycaemia**
- **Seizure with Todd paralysis**
- **Complicated migraine**
- **Structural brain lesion (tumour, haemorrhage, aneurysm)**
- **Demyelinating disease (multiple sclerosis)**
- **Central nervous system infection (encephalitis, cerebritis, abscess)**
- **Acute vestibular syndrome (labyrinthine disorders)**
- **Delirium**
- **Recurrent episode of old stroke**
- **Syncopal (of any aetiology)**
- **Metabolic disorder (hypoponthaemia, hypokalaemia, etc.)**
- **Peripheral nervous system lesion (radiculopathy, neuropathy, plexopathy)**
- **Psychogenic (conversion disorder, somatization)**

### Abbreviations:
- CT: computed tomography
- DMI: diffusion weighted imaging
- ECG: electrocardiogram
- ED: emergency department
- IV: intravenous
- MRI: magnetic resonance imaging
- TIA: transient ischaemic attack

---

**Consult a Physician**

**See 17. Stroke Algorithm**

---

**Complete etiological workup within 48 hours (Class II)**
- **Recommended carotid vessel imaging, when appropriate (Class II)**
- **Disposition to ED outpatient unit, inpatient, or urgent TIA clinic, depending on local resources and institutional standards (Class II)**
20. Seizures Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

**History of Seizure**
- Maintain and support ABCs
- Monitor vital signs (BP, PR, RR, SPO₂, T° C)
- Start Oxygen if SPO₂ < 94%
- Maintain SPO₂ ≥ 94%
- Check RBS

**First-time Seizure**

**Known Epileptic or >1 seizure**
- Send samples for MPS, UEC, HIV, (Urinalysis if pregnant or post-partum)

**If pregnant or post-partum**, load with IV Magnesium sulphate 4gm diluted in 100mL NS over 15 mins. Continue with an infusion of 2gm/hr

**Active seizure / Post ictal / Status Epileptics**
- (> 5 minutes of a continuous seizure, or ≥ 2 discrete seizures between which there is incomplete recovery of consciousness.

**Ictal**
- Position patient on soft mattress/pillows on trolley in left lateral position and open the airway with head-tilt manoeuvre; maintain this position until patient is awake
- Do NOT restrain a seizing patient
- Maintain and support ABCs. Provide O₂ by Non-Rebreather mask at 15L/min
- Check RBS

**Post Ictal**
- Monitor vital signs (BP, PR, RR, SPO₂, To C, RBS)

**Still Seizing Or Recurrent Seizure**
- Set up IV access and give Midazolam 0.1mg/Kg
- If difficult or no IV access, give Midazolam 0.1mg/Kg IM
- Send samples for MPS, UEC, HIV, (Urinalysis if pregnant or post-partum, Phenytoin/Na Valproate levels as applicable)

**Post Ictal**
- Monitor vital signs (BP, PR, RR, SPO₂, T° C, RBS)

**Still Seizing Or Recurrent Seizure**
- Repeat Midazolam 0.1mg/Kg IV after 10 minutes from last dose
- Load with phenytoin at 20 mg/kg IV in NS strictly over 30 mins.
- OR
- Load with Na Valproate 20mg/kg IV push if on ARVs
- OR
- If pregnant or post-partum, load with IV Magnesium sulphate 4gm diluted in 100mL NS over 15 mins. Continue with an infusion of 2gm/hr

**Post Ictal**
- Monitor vital signs (BP, PR, RR, SPO₂, T° C, RBS)

**Still Seizing Or Recurrent Seizure**
- Consult a Physician/OBGYN and continue with algorithm
- Repeat Midazolam 0.1mg/Kg IV after 10 minutes from last dose
- Consider hypoglycaemia, hyponatraemia, drug overdose
- If still in seizing, additional phenytoin at 5 mg/kg IV in NS strictly over 10 mins. Repeat again once if necessary. Obtain phenytoin level 30-60 minutes after completion of infusion. (Aim for > 10mg/L)

**Criteria for discharge:**
- First onset single seizure in a patient < 40 years who has completely recovered from their seizure and for whom no clear-cut cause has been identified (e.g., hypoglycaemia, hyponatraemia, toxicity, drug overdose)

**Consult a Physician on ALL other patients.**

**Intubate and ventilate patient; keep T° C ≤ 37°C**
- Propofol 1mg/kg IV + Rocuronium 1.2mg/kg
- Start infusion of midazolam 0.1mg/kg/hour IV
- Obtain CT Head (if not pregnant) and review with ALL the results.
- Admit ICU. Consult a Physician/OBGYN
Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) “view” the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

21. Syncope Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

History of Syncope

Syncope is a symptom complex that is composed of a brief loss of consciousness associated with an inability to maintain postural tone that “spontaneously” (i.e., no postictal period with a rapid recovery) and “completely” (no residual neurologic deficit) resolves without medical intervention. Near-syncope is defined as a patient almost losing consciousness, and it is approached in the same way as syncope.

Consider seizure - tongue biting, head turning during loss of consciousness, no recollection of abnormal behaviour, prolonged limb jerking (lasting minutes), incontinence post-event confusion, and prodromal aura.

Yes

Go to 20. Seizures Algorithm

No

• Check RBS – If RBS < 3.3 mmol/L – see 28. Hypoglycaemia Algorithm
• 12 lead ECG - Look for evidence of ischemia/infarction, dysrhythmias, atrioventricular blocks, Brugada syndrome (RBBB with J-wave elevation of ≥ 2 mm), prolonged QT interval, ventricular pre-excitation, hypertrophic cardiomyopathy

Consider dangerous causes of syncope

Neurally mediated syncope
  – Subarachnoid haemorrhage
  – Seizure

Orthostatic hypotension-mediated syncope
  – Ectopic pregnancy
  – Gastrointestinal haemorrhage
  – Medication-induced orthostatic hypotension*

Cardiovascular-mediated syncope
  – Dysrhythmias
  – Acute coronary syndromes (rare < 2%)
  – Aortic dissection
  – Pulmonary Embolism (rare < 1%)
  – Patients with bradycardia*

* patients who may benefit from intervention.

None of the above

The San Francisco Syncope Rule (SFSR) (available in MDCalc)
The SFSR uses five factors (CHESS predictors) to predict serious adverse outcomes at 7 or 30 days in patients presenting to the ED.

1. History of Congestive Heart Failure
2. Haematocrit < 30% (Hb < 10g/dL) (test if clinically indicated)
3. ECG abnormality (see above)
4. History of Shortness of breath
5. SBP < 90 mm Hg after arrival in the ED

SFSR is associated with a pooled negative predictive value of 97%, sensitivity of 87%, and negative LR of 0.28. Patients with negative SFSR scores had < 3% risk for serious outcomes.

Does the patient have ANY of the 5 SFSR predictors?

Yes

Consult a Physician

No

Discharge
22. Trauma Management Pathway

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

SAMPLE HISTORY
- Signs and Symptoms
- Allergies
- Medication
- Past Medical History/Pregnancy
- Last meal/Last Tetanus Injection/Last Medication/Drug/Alcohol intake
- Events preceding presentation

ACTIVATE THE TRAUMA TEAM (see Trauma Team Activation Criteria on the next page)

Primary Survey (C-ABCDE)
STOP ANY EXTERNAL MASSIVE BLEEDING IMMEDIATELY
C-Spine – Cleared Clinically (see 23. C-Spine Clearance Algorithm)? Perform Manual In-Line Stabilization (MILS) then apply Head Blocks or Blanket Rolls taped to the patient’s head and trolley. DO NOT APPLY A C-COLLAR
Airway – Open? Maintainable? Intubate?
Disability – GCS? (available in MDCalc) Pupils? RBS?
Expose patient

Resuscitation (C-ABCDE)
C
- If suspected trauma and not cleared clinically, Head Blocks or Blanket Rolls strapped to the patient’s head and trolley?
A
- Rapid Sequence Intubation?
B
- Supplementary Oxygenation? – Non-Rebreather mask
- Immediate decompression for Tension Pneumothorax with subsequent immediate Intercostal Chest Drain Insertion?
- Emergency Intercostal Chest Drain for Massive Haemothorax or Open sucking chest wound
C
- Control Active Bleeding including:
  • Apply a Pelvic wrap to an Open Book Pelvic Fracture
  • Apply a Traction splint for Femur Fractures
- Insert 2 large bore IV lines and give appropriate fluid resuscitation (NS/RL/Whole blood). Adult trauma patients with, or at risk of, significant bleeding should be given Tranexamic acid loading dose 15mg/kg over 10 min then infusion of 1.5mg/kg/h.
- FHH, UEC, GKM and request adequate supplementary blood and blood products
D
- Correct Hypoglycaemia – 50mls 50% Dextrose IV
- Give appropriate analgesia e.g. Fentanyl 1ug/kg IV (see Analgesia Chart and 41. Pain Management Algorithm for Regional Anaesthesia)
- Give IV Phentoin (20mg/kg) for Severe Head Injury (GCS ≤ 8)
E
- Check temperature and avoid hypo- or hyperthermia

Secondary Survey (Head-to-Toe Survey)
Chest – Lacerations? Rib Fractures?
Limbs – Lacerations? Fractures? Distal Pulses and Neurology?
Log roll patient – Lacerations? Spine tenderness?
Do not forget to clean all open wounds with running tap water for at least 10 minutes and give Tetanus Toxoid. Give ANTIBIOTICS within 1 hour of injury for ALL COMPOUND FRACHTURES. Therapeutic doses of cefazolin, clindamycin, for 48 hrs are appropriate; with contamination, consider anaerobic antibiotics (penicillins, clindamycin, metronidazole); NO ANTIBIOTICS are required for soft tissue injuries unless there is evidence of an infection.

Radiological Investigations
- Extended Focussed Assessment with Sonography in Trauma (EFAST) – ONLY for;
  • Penetrating chest trauma – Pneumothorax? Haemothorax? Cardiac Tamponade?
  • Unexplained hypotension ? Free fluid in pleural, pericardial or peritoneal cavity
- CT-Abdomen – For the haemodynamically stable patient with suspected blunt abdominal trauma
- CT Head – ONLY for;
  • GCS ≤ 15 (for GCS 15 – see 24. Mild Traumatic Brain Injury Algorithm)
  • Skull fractures including Base of Skull Fractures (DO NOT ORDER SKULL X-Rays)
- C-Spine X-rays (AP, Lateral AND Open Mouth) – see 23. C-Spine Clearance Algorithm. If doing a CT head, do CT Spine instead of C-spine X-rays if indicated.
- C-spine is NOT cleared on X-rays/CT BUT on resolution of patient symptoms
- Pelvic X-ray – ONLY for patients with;
  • Lower abdominal pain
  • Lower back pain
  • Femur fractures
  • Clinically tender pelvis
  • Patients unable to mobilize
- Knee X-ray – See Ottawa Knee Rule in MDCalc
- Ankle X-ray – See Ottawa Ankle Rule in MDCalc

Where a reliable clinical assessment is not possible ALL the investigations should be done.
Introduction
Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG
The six chest leads (V1 to V6) “view” the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Trauma Team Activation Criteria

The Trauma team comprises a group of emergency department doctors/clinical officers and nurses, surgeons, anaesthetists and theatre staff, radiographers and other support personnel, who work together as a team to assess and manage the trauma patient. Their actions are coordinated by a team leader who should not touch the patient. The aim of the trauma team is to provide a safe and efficient evaluation of the patient. Identify all injuries and instigate definitive management of such injuries. Most trauma teams will have about 30 minutes to accomplish this and should work towards achieving this goal.

The Trauma Team should be activated immediately a patient who meets ANY of the criteria below arrives:

- Systolic BP < 90 mmHg
- Respiratory rate < 10 breaths/min or > 30 breaths/min
- GCS < 12 with torso or extremity trauma
- Pregnant patient (> 20 weeks) with foetal heart rate < 120 bpm or >160 bpm
- Amputation proximal to elbows or knees
- 2 or more proximal long bone fractures
- Suspected spinal cord injury
- Severe maxillofacial injury with airway compromise
- Burns > 15% TBSA
- Pregnant patient with penetrating injury or significant blunt injury
- Gunshot wound proximal to knee or elbow
- Significant penetrating wound to head, neck, chest, abdomen or groin
- Ejection from vehicle
- Pedestrian thrown (hit by a car) or rolled over
- Fall from a height > 6 metres (20 feet)
- Simultaneous arrival of 3 or more multi-trauma patients
- Emergency Doctor feels trauma team is necessary for an injured patient
23. C-Spine Clearance Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

See 22. Trauma Management Pathway
For Alert (Glasgow Coma Scale Score = 15) and Stable Trauma Patients Where Cervical Spine (C-Spine) Injury is a Concern

Perform Manual in-Line Stabilization of the C-Spine
Maintain and support ABCs

(Canadian & Nexus C-Spine Rules available in MDCalc)
□ Age ≥ 65 Years
□ Glasgow Coma Scale score of 14 or less
□ Decreased alertness secondary to intoxication
□ Disorientation to person, place, time, or events
□ Inability to remember 3 objects at 5 minutes
□ Delayed or inappropriate response to external stimuli
□ Any focal deficit on motor or sensory examination or paraesthesia in extremities

Yes

□ Midline Neck Pain
□ Midline C-spine Tenderness (C1 – T1)
Provide immediate adequate analgesia

No

□ Able to Actively Rotate Neck 45° Left and Right Without Pain? The doctor should allow the patient to perform the above movement while maintaining in-line stabilization without moving the patient’s neck

Yes

No

Not Radiography Necessary
Document clearly in patient’s clinical notes successful completion of ALL the above steps

□ Midline Neck Pain
□ Midline C-spine Tenderness (C1 – T1)
Provide immediate adequate analgesia

Yes

No

□ Able to Actively Rotate Neck 45° Left and Right Without Pain? The doctor should allow the patient to perform the above movement while maintaining in-line stabilization without moving the patient’s neck

Yes

No

C-Spine Cleared on Radiology?

Yes

No

Review X-rays and/or CT C-spine images and the patient

□ C-Spine Cleared on Radiology?

Yes

No

Consult an Orthopaedic Surgeon
Maintain immobilization with the patient flat on a trolley with Head Blocks or Blanket Rolls strapped to the patient’s head and trolley

DO NOT INTERPRET INADEQUATE IMAGES

□ Obtain CT C-spine IF;
- patient is to receive an immediate CT head. No c-spine X-rays are required initially
- X-rays are inadequate
- patient has persistent symptoms despite analgesia and negative X-rays
- pathology is noted on c-spine X-rays

Remove Immobilization devices
24. Mild Traumatic Brain Injury Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

See 22. Trauma Management Pathway

Adult in ED with GCS 15

Canadian CT Head Rule available in MDCalc
Assess for:
- Suspected open or depressed skull fracture
- Physical signs of basilar skull fractures (hemotympanum, ‘panda’ eyes, cerebrospinal fluid leakage from the ear or nose, Battle’s sign)
- Vomiting ≥ 2 or more episodes
- Age ≥ 65 years
- Retrograde amnesia ≥ 30 mins
- Dangerous mechanism of injury:
  - Ejection from a motor vehicle
  - Pedestrian struck
  - Fall from a height of > 0.9m or 5 steps
- Coagulopathy, bleeding disorder, or on anticoagulant or anti-platelet agent except aspirin

Discharge as below

Any positive finding?
Yes

Obtain Non-Contrast Head CT scan

No

CT Positive

Consult a Neurosurgeon and assess for admission

Is patient on anticoagulant or anti-platelet agent except aspirin

No

Discharge as below

Yes

- If symptomatic or INR > 3, admit for 24 h observation
- If asymptomatic after 6 h ED observation and INR < 3, discharge with reliable adult
- Close follow-up in out-patient clinic
- Return for repeat CT if new or worsening symptoms

Discharge

A CT interpreted as normal by the Radiologist in a neurologically intact person with a normal mental status allows for safe discharge with appropriate instructions and avoids prolonged ER observation or hospital admission. WRITTEN and VERBAL Discharge Instructions (see MINOR HEAD INJURY DISCHARGE ADVICE) must be provided and should include symptoms to expect after a mild TBI, the time course, the overall positive prognosis, activity limitations, and the point at which a patient return to the ED for further testing.
Minor Head Injury Discharge Advice

On returning home it is important that, if possible, you are accompanied by a responsible adult. While unlikely, there is a small risk of developing complications, so if you experience any of the following symptoms in the next few days you should return to ED as soon as possible.

- Loss of consciousness
- New deafness in one or both ears
- Loss of balance or problems walking
- Any weakness in one or both arms or legs
- Any vomiting
- Clear fluid coming out of your ears or nose
- Drowsiness when you would normally be wide awake
- Increasing disorientation
- Problems understanding or speaking
- Blurred or double vision
- Severe headache not relieved by painkillers such as paracetamol
- Bleeding from one or both ears
- Any fits (collapsing or passing out suddenly)
- Inability to be woken

Dos and Don’ts

DO make sure you stay within reach of a telephone and medical help in the next few days
DO have plenty of rest and avoid stressful situations
DO show this factsheet to a friend or family member who can keep an eye on your condition
DO take painkillers such as paracetamol for headaches
DON’T stay at home alone for 48 hours after leaving hospital
DON’T drink alcohol until you feel better
DON’T take aspirin or sleeping tablets without consulting a doctor
DON’T return to work until you feel ready
DON’T play any contact sport for at least three weeks without consulting your doctor
DON’T return to driving until you feel you have recovered. If in doubt consult your doctor.

While most people recover quickly you may experience some of the following symptoms over the next few days and weeks, which don’t require a return to hospital:

- Headaches
- Feelings of dizziness
- Nausea
- Sensitivity to light or noise
- Sexual difficulties
- Sleep disturbance
- Memory problems
- Thinking and problem-solving
- Irritability
- Restlessness
- Impulsivity and self-control problems
- Difficulties with concentration
- Feeling depressed, tearful or anxious
- Fatigue
- Difficulties

In most cases these symptoms will resolve themselves within two weeks. However, in some cases they may persist much longer. Try not to rush back into normal activities, as this may delay recovery. If you still have any symptoms after two weeks we suggest you come back to the ED and take this factsheet with you. It may be possible to seek referral to a head injury specialist such as a neurologist or neuropsychologist.

For medical advice, contact the Emergency Department on: __________________________

25. Bites (Animal & Human), Tetanus & Rabies

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Animal Bites
If rabies is a concern, scrub the wound with soap and water for at least 15 minutes, then rinse and apply a disinfectant (e.g. iodopovidone) as soon as possible after exposure. The use of antibiotics in patients with animal bites is controversial, and some studies have shown little benefit. However, pre-emptive early antimicrobial therapy for 3–5 days is recommended for patients who:

- are immunocompromised;
- are asplenic;
- have advanced liver disease;
- have pre-existing or resultant oedema of the affected area;
- have moderate to severe injuries, especially to the hand or face; or
- have injuries that may have penetrated the periosteum or joint capsule

ALL Human bites should receive:
- prophylactic antibiotics
- consider post-exposure prophylaxis for HIV within 72hrs. The risk associated with bite injuries has not been quantified. The victim is usually at low risk unless the biter’s saliva is contaminated with blood. The risk is greater to the biter if blood is drawn from the victim’s wound because of exposure to mucous membranes.
- Hepatitis B vaccine preferably ≤ 24 hours if not previously immunized

Treatment:
DO NOT SUTURE ANIMAL AND HUMAN BITES. The above wounds should be irrigated copiously, dressed, left open to drain, and examined daily to detect signs of infection. During the first few days after injury, elevation of the injured body part, especially if swollen, accelerates healing. This should be accomplished using a passive method (a sling for outpatient or a tubular stockinet and an intravenous pole for inpatients). ALL infected wounds should be treated. If no signs of infection, delayed primary closure may be done 72 hours after the injury.

Antibiotics
Amoxicillin/Clavulanate 1gm BD x 5–7 days
In Penicillin Allergic Patients:
Clindamycin 300 mg PO QID/600 mg IV TDS OR Azithromycin 500mg PO OD for 3 days

PLUS

Tetanus Toxoid 0.5mg IM

<table>

Rabies Post-Exposure Prophylaxis
The WHO rabies exposure categories are:

- Category I: Touching or feeding animals, licks on intact skin
- Category II: Nibbling of uncovered skin, minor scratches or abrasions without bleeding
- Category III: Single or multiple transdermal bites or broken skin with saliva from animal licks, exposure due to direct contact with bats

Rabies Immunglobulin (RIG)
RIG provides passive immunization and is administered in the wound site only once, as soon as possible after the initiation of PEP and not beyond day 7 after the first dose of vaccine

Rabies Vaccine
Herpes Ig - 20U/Kg OR Equine Ig - 40U/Kg

Intradermal (ID)
Recommended sites: left and right deltoids, thigh or suprascapular areas

Dose: 0.1ml

Recommended sites: Deltoids, lateral thighs or suprascapular areas that drain into regional lymph glands

Recommended sites for children aged <2 years: the anterolateral thigh

Rabies vaccine should not be administered in the gluteal area, as induction of an adequate immune response is less reliable.

Intramuscular (IM)
Dose: 1 vial

Recommended sites: Deltoids, lateral thighs or suprascapular areas

Recommended sites for children aged <2 years: the anterolateral thigh

Rabies vaccine should not be administered in the gluteal area, as induction of an adequate immune response is less reliable.

Patients bitten by healthy appearing domestic animals may delay rabies post exposure prophylaxis if the animal is quarantined. These animals should be observed for 10 days, and if they show no sign of infection during the observation period they may be released, and the patient does not need to be vaccinated. Signs of infection in an animal include excessive salivation, aggression, paralysis, daytime activity in nocturnal animals, and impaired movement. If the animal shows any signs of infection, the patient should start the vaccination schedule and continue until the animal has been tested at an approved facility.
Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Common Venomous Snakes of Kenya

FOR ALL SNAKEBITES VISIT A HEALTH FACILITY IMMEDIATELY!

- Eastern Green Mamba
- Egyptian Cobra
- Forest Cobra
- Forest Night Adder
- Gaboon Viper
- Gold's Tree Cobra
- Green Bush Viper
- Jameson's Mamba
- Kenya Horned Viper
- Kenya Montane Viper
- Large Brown Spitting Cobra
- Mount Kenya Bush Viper
- North East African Carpet Viper
- Puff Adder
- Red Spitting Cobra
- Rhinoceros Viper
- Rough-Scaled Bush Viper
- Savannah Vine Snake / Twig Snake
- Small-Scaled Mole Viper
- Snouted Night Adder
- Velvet Green Night Adder
- Yellow Bellied Sea Snake

<td>Coastal Boomslang, North East- African Carpet Viper (Echis), Vine Snake, Blanding’s Tree Snake</td>
</tr>
</tbody>
</table>

Clinical Picture

- Establish IV access
- Give analgesia
- Position the limb at the level of the heart
- Give IV fluid for shock and renal failure
- Treat local complication appropriately

Management

- Establish IV access
- Monitor oxygenation and ventilation closely (HDU)
- Intubation and mechanical ventilation may be necessary
- Establish IV access
- Give blood/blood component therapy if indicated
- Heparin, antifibrinolytics, thrombolytics are of no value and may be dangerous

Indications for Antivenom

- Polyvalent antivenom
  - Swelling progressive at ≥15cm/hr
  - Swelling to a knee or elbow from a foot or hand bite within 4 hours
  - Swelling of a whole limb by 8 hours
  - Swelling threatening the airway
  - An associated coagulopathy
  - Unexplained dyspnoea
  - Consider antivenom if snake is unknown but envenomation is severe.

- Polyvalent antivenom
  - Triad of (either)
    1. paraesthesia,
    2. excessive salivation/metallic taste and sweating
    3. dyspnoea
  - In the absence of painful progressive swelling (mambas)
  - Paresis in the presence of significant swelling (non-spitting cobras)

- Monovalent antivenom
  - Active bleeding
  - Positive 20 MINUTE WHOLE BLOOD CLOTTING TEST (20WBCT)
  - Take 2 ml of blood from the patient and pour it into a new, clean, dry glass test tube.
  - The test tube must be made of glass and NOT plastic. The tube MUST be new. Avoid old tubes that have been washed in detergent/soap.
  - Leave the test tube undisturbed at ambient temperatures for 20 min.
  - After waiting for 20 min gently tilt the test tube.
  - If the blood is all liquid (no clots) then the patient has incoagulable blood.
  - Laboratory evidence of coagulopathy

Administration of Antivenom:

- Give the first dose (10ml) of antivenom intravenously at the slow rate of 1-2 ml per minute. Subsequent doses may be injected into a bag of saline drip, no more than 20 ml per 500ml bag to run in 30 mins. Repeat until symptoms resolve. Monitor breathing and other vital signs continuously. Remember not to have the drip running direct into the wounded limb which is already in danger from the pressure of swelling and should be kept elevated and well protected.
- Remember to have adrenaline (1:1,000) at the bedside in case of anaphylaxis. If the patient has known allergies (asthma etc.), draw up the adrenaline (0.3 - 0.5 ml for adults and 0.1 - 0.3 for children) and have antihistamine available in case allergic symptoms are overwhelming. Antihistamine is NOT recommended as routine treatment for snakebite.
- Monitor breathing and other vital signs continuously.
- DO NOT infiltrate the bite area with antivenom.
**Introduction**

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

**How to do an ECG**

The six chest leads (V1 to V6) “view” the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

**Burns Resuscitation Pathway (Assessment)**

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

**SAMPLE HISTORY**

- Signs and Symptoms
- Allergies
- Medication
- Past Medical History/Pregnancy
- Last meal
- Events preceding presentation

**ACTIVATE THE TRAUMA TEAM** (see Trauma Team Activation Criteria)

**Primary Survey (C-ABCDE)**

- C-Spine – If suspected trauma, Cleared Clinically (see 23. C-Spine Clearance Algorithm)? Perform Manual In-Line Stabilization (MILS) then apply **Head Blocks** or **Blanket Rolls** taped to the patient’s head and trolley. **DO NOT APPLY A C-COLLAR**

- Airway – Open? Maintainable? Intubate? Indications for intubation include presence of pharyngeal burns, air hunger, stridor, carbonaceous sputum and hoarseness, unconscious patients, hypoxic patients with severe smoke inhalation, or patients with flame or flash burns involving the face and neck.

- Breathing – Rate? SPO2? Air entry bilaterally?

- Disability – GCS? Pupils? RBS?

- Expose patient

**1st Degree Burns**

- Epidermis only
- Commonly caused by UV light or very short flash or flame exposure
- Skin is red, dry & hypersensitive
- No treatment except analgesia
- Leaves no scarring on healing

**2nd Degree Burns**

**Superficial;**

- Epidermis + Upper ⅓ of Dermis
- Commonly caused by scald (spill or splash)
- Red, moist, weeping, cob blisters that blanche with pressure
- Painful - due to nerve exposure, & heals from 7-14 days
- Leaves no scarring on healing but there is potential pigmentary changes

**Deep;**

- Epidermis + Upper ⅔ of Dermis
- Commonly caused by scald, flame, chemicals, oil & grease
- Cheesy white, wet or waxy dry; Do not blanche with pressure
- Healing takes > 21 days
- Severe scarring & risk of contractures

**3rd Degree Burns**

- Full Epidermis + Dermis are destroyed leaving no cells to heal
- Commonly caused by scald, steam, flame, chemicals, oil, grease & high voltage electricity
- Grey to charred & black, insensate, contracted, pale, leathery tissue
- Severe scarring & high risk of contractures

**Total Body Surface Area (TBSA)**

</tbody>
</table>

**Burn Estimation Lund and Browder Charts**

- Do not include first degree burns in the calculation of % TBSA. The surface area of a patient’s palm (including fingers) is roughly 1% of TBSA. Palmar surface can be used to estimate relatively small burns (< 15% of total surface area) or very large burns (> 85%, when unburnt skin is counted). For medium-sized burns, it is inaccurate.
Burns Resuscitation Pathway (Resuscitation)

**Resuscitation (C-ABCDE)**

**CONSULT A SURGEON IMMEDIATELY AS YOU BEGIN RESUSCITATION OF ANY BURNS PATIENT WITH 3RD OR 4TH DEGREE BURNS AND CIRCUMFERENTIAL BURNS (also see Trauma Team Activation Criteria)**

C – If suspected C-Spine trauma and NOT cleared clinically, **Head Blocks** or **Blanket Rolls** strapped to the patient’s head and trolley?

A – Rapid Sequence Intubation? **Avoid succinylcholine in patients with burns > 24hrs** due to risk of hyperkalaemia. Indications for intubation include presence of pharyngeal burns, air hunger, stridor, carbonaceous sputum and hoarseness, unconscious patients, hypoxic patients with severe smoke inhalation, or patients with flame or flash burns involving the face and neck.

B – Supplementary Oxygenation? If suspected **carbon monoxide poisoning** (restlessness, headache, nausea, poor co-ordination, memory impairment, disorientation, or coma), give **100% oxygen via a Non-Rebreather mask at 15L/min for 24 hrs**

C – Control Active Bleeding

- **Do not include first degree burns in the calculation of % TBSA**
- Patients with < 10% TBSA burns can be resuscitated orally (unless the patient has an electrical injury or associated trauma). This needs on-going evaluation and the patient may still require an IV line.
- Patients with burns involving ≥ 20% of TBSA will require intravenous fluid resuscitation. Insert 2 large bore IV/IO lines and give appropriate fluid resuscitation (RL/NS/whole blood). **Parkland Formula** (available in MDCalc) – **Total fluids over 24hrs = 4ml/kg/%TBSA**. Give ½ of this volume within the first 8hrs of the burns then the next ½ over the next 16hrs + maintenance fluid for children < 30 kg. Aim for a urine output of 1 mL/kg/hour in children younger than 2 years (or who weigh < 30 kg) and 0.5 mL/kg/hour in adults and older children. If urine output is not adequate, increase fluids for the next hour to 150% of calculated volume until urine output is adequate.
- **GXM** and request adequate supplementary blood and blood products if necessary

D – Correct Hypoglycaemia – 50ml 50% Dextrose IV
- **Give appropriate analgesia e.g. Fentanyl 1μg/kg IV** (see Analgesia Chart); Consider procedural sedation with Ketamine for wound dressing (see 44. Procedural Sedation and Analgesia (PSA))

E – Check temperature and provide warmth to the patient
- Cool any burns < 3 hours old with **cold tap water for at least 30 minutes** and then dry the patient. In patients undergoing external cooling who have burns covering ≥ 10% of TBSA, monitor body temperature for hypothermia.
- Remove all clothes, jewellery, necrotic tissue & debris
- Wash wound with mild soap and tap water
- **DO NOT BURST BLISTERS**. Blisters let intact heal faster and become infected less often.

**Secondary Survey (Head-to-Toe Survey) and Other Considerations**

- In neck survey, a pillow is placed under the patient’s head to hyperextend the neck at the shoulders to prevent contractures
- Chest wall burns - Do a checker-box release - consult a Surgeon
- Upper limb burns should be nursed elevated at 45°
- Evaluate 3rd & 4th Degree Burns and circumferential burns for possible escharotomy, consult a Surgeon
- Give Tetanus Toxoid.
- **Topical antimicrobial agents** or bioengineered substitutes should be applied to all clean, debrided wounds except superficial burns. Prophylaxis with systemic antibiotics is currently NOT RECOMMENDED for patients with severe burns other than perioperatively.

**Disposition**

Minimum criteria for transfer to a burns centre (Modified from the Australian and New Zealand Burn Association (ANZBA) protocol)

**Burn injury patients who should be referred to a burn unit include the following:**

- All burn patients less than 1 year of age
- All burn patients from 1-2 years of age with burns > 5% total body surface area (TBSA)
- Patients in any age group with third-degree burns of any size
- Patients older than 2 years with partial thickness burns greater than 10% TBSA
- Patients with burns of special areas – face, hands, feet, genitalia, perineum or major joints
- Patients with electrical burns, including lighting burns
- Chemical burn patients
- Patients with inhalation injury resulting from fire or scald burns
- Patients with circumferential burns of the limbs or chest
- Burn injury patients with pre-existing medical disorders that could complicate management, prolong recovery or affect mortality
- Any patient with burns and concomitant trauma
- Paediatric burn cases where child abuse is suspected
- Burn patients with treatment requirements exceeding the capabilities of the referring centre
- Septic burn wound cases
27. Post Rape Care (PRC) Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

This algorithm should be used with reference to the documents in the latest National Guidelines on Management of Sexual Violence in Kenya available at www.emergencymedicinekenya.org/rape

**Introduction**

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as investigating normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

The information from these 12 leads is combined to form a standard electrocardiogram.

---

**PART A of PRC form**

*Assess, monitor and support ABCs. Monitor vital signs. Get same sex chaperone.*

*Fill PRC Consent form.*

*Fill PART A of PRC form in triplicate.*

*As you examine the patient, collect specimens as detailed below and store them in a secure locked cupboard.*

*Put all clothes in BROWN PAPER BAGS (NOT PLASTIC) and label with patient details.*

*Give STAT PEP within 72 hours.*

- TDF/3TC (300/300mg) 1 tab OD + ATV/r (300/100mg)
- AZT (300mg) can be used when TDF cannot be used Do NOT delay PEP administration by awaiting lab results.

*Order investigations as PART A of PRC form and fill in results: HIV (do pre-test counselling).*

---

**PART B of PRC form**

*Assess, monitor and support ABCs. Monitor vital signs. Get same sex chaperone.*

*Fill PRC Consent form.*

*Fill PART A of PRC form in triplicate.*

*Put all clothes in BROWN PAPER BAGS (NOT PLASTIC) and label with patient details.*

*Order investigations as PART A of PRC form and fill in results: HIV (do pre-test counselling).*

---

**Treatment**

### 1. Emergency Contraception within 120 hours (females 15-49 years)

- Levonorgestrel 0.75mg - 2 tabs stat

### 2. STI Prevention:

- I.M Ceftriaxone 250mg stat or PO Cefixime 400mg stat + PO Azithromycin 1g stat + PO Tinidazole/Metronidazole 2g stat. Tinidazole/Metronidazole can be deferred to be taken at home if alcohol ingested or given emergency contraceptives.

### 3. Hepatitis B Vaccination

(If not previously vaccinated and not known HBV positive) should be offered within 14 days.

- I.M 1.0 ml Hepatitis B vaccine at 0, 1 & 6 months.

### 4. Tetanus Prophylaxis

(Do not give TT if the survivor has received 3 or more doses previously and the last dose is within 5 years)

- I.M 0.5 ml of T.T stat

### 5. HPV Vaccine

(females 9-26 years and males 9-21 years)

- I.M Gardasil® at 0, 2 & 6 months

**On discharge:**

- Confirm PART A & B of PRC form are filled. Attach blue copy to patient’s file and give white copy to patient. Leave the green copy in the PRC booklet.

- Confirm patient understands drug regimen
- Give patient belongings in well-labelled brown bag
- Nearest Gender Based Violence Recovery Centre (GBVRC) booking in one week
- Give patient discharge summary with all the follow-up dates as listed above

**Follow-up**

- Counselling. Trauma counselling in 2, 4, 6 and 12 weeks + Adherence counselling
- Gender Based Violence Recovery Centre (GBVRC) for PEP follow-up at 7, 14 and 28 days.
- Repeat CBC, ALT, CR in 2 weeks, PDT in 4 weeks, HIV test in 4, 12 & 24 weeks
- HIV care clinic if HIV positive

---

**Contact the Kenya Police to Collect All Specimens & Clothes (Must Be in Labelled Brown Paper Bags (Not Plastic))**

---

**Emergency Contraction within 72 hours (ONLY IF ACCEPTS HIV TESTING)**

- TDF/3TC (300/300mg) 1 tab OD + ATV/r (400/199mg) with food 1- tab OD for 28 days.
- AZT (300mg) can be used when TDF cannot be used Do NOT delay PEP administration awaiting lab results.

---

**On discharge:**

- Confirm PART A & B of PRC form are filled. Attach blue copy to patient’s file and give white copy to patient. Leave the green copy in the PRC booklet.

- Confirm patient understands drug regimen
- Give patient belongings in well-labelled brown bag
- Nearest Gender Based Violence Recovery Centre (GBVRC) booking in one week
- Give patient discharge summary with all the follow-up dates as listed above

**Follow-up**

- Counselling. Trauma counselling in 2, 4, 6 and 12 weeks + Adherence counselling
- Gender Based Violence Recovery Centre (GBVRC) for PEP follow-up at 7, 14 and 28 days.
- Repeat CBC, ALT, CR in 2 weeks, PDT in 4 weeks, HIV test in 4, 12 & 24 weeks
- HIV care clinic if HIV positive
28. Hypoglycaemia Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient's individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Hypoglycaemia (RBS < 3.3 mmol/L)

- Monitor, support ABCs
- Check vital signs (BP, PR, RR, SPO₂, T° C)
- Start Oxygen if SPO₂ < 94%. Maintain SPO₂ ≥ 94%

Able to tolerate PO

- Give 15gm of simple carbohydrate PO
  AND/OR
  A full complex starchy carbohydrate meal e.g. rice, ugali, wholemeal)

IV Access

- 50mls 50% Dextrose IV*

No IV Access

- Glucagon 1mg SC or IM
  As soon as IV access is available, give 50mls 50% Dextrose IV

Symptoms resolved and RBS > 3.3mmol/L

- Yes
  Repeat Algorithm
  After 2 rounds of the algorithm, begin continuous infusion of 5% Dextrose saline at 110mls/hr
- No
  - Provide patient with a full complex starchy carbohydrate meal e.g. rice, ugali, wholemeal) or begin continuous infusion of 5% Dextrose saline at 110mls/hr
  - Treat underlying cause
  - Maintain blood glucose level above 4.4 mmol/L
  - Consider thiamine 100mg IVI for malnourished and alcoholic patients followed by 100mg PO BD for 6 weeks
  - Consult a Physician for ALL patients

* Dextrose Rule of 50

How to correct hypoglycaemia:
- Neonate: 5 ml/kg of 10% Dextrose (10×5=50)
- Infant: 2 ml/kg of 25% Dextrose (25×2=50)
- Older child or Adult: 1 ml/kg of 50% Dextrose (50×1=50)

How to make different Dextrose solutions:
- 50 ml of 50% Dextrose + 50 ml NS = 25% Dextrose
- 50 ml of 50% Dextrose + 150 ml NS = 12.5% Dextrose
29. Hyperglycaemia Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Hyperglycaemia (RBS > 14mmol/L)

- Monitor, support ABCs
- Check vital signs (BP, PR, RR, SPO₂, T° C)
- Start Oxygen IF SPO₂ < 94%. Maintain SPO₂ ≥ 94%
- Establish IV Access and send samples for Serum Ketones, Venous Blood Gas (VBG)*, UEC and Urinalysis
- Obtain/review 12-lead ECG (if indicated)
- Perform brief, targeted, history and physical exam
- DO NOT GIVE INSULIN

*ABG Analysis available in MDCalc. A VBG often correlates well with ABG findings (except for PaO₂) unless values are extremely abnormal

Normal VBG + Serum Ketones < 1.5 mmol/L + Serum Osmolality < 320mOsm/kg

Go to

30. Diabetic Ketoacidosis/Hyperosmolar Hyperglycaemic State (HHS) Algorithm

Uncomplicated Hyperglycaemia

Identify and Treat precipitating illness; consider ACS, Sepsis

Known Diabetic

- Confirm compliance with medication
  - If not compliant, resume previous regimen
- If compliant, optimize dosages
- Advice on lifestyle Modification
- Review RBS daily at nearest facility and keep record
- Review in out-patient medical clinic after 5 days
- Refer to Diabetic clinic if poorly controlled

Newly Diagnosed Diabetic

- Lifestyle modification advice
  - Start on Metformin as below
    - Begin with low-dose metformin - 500 mg BD with meals (breakfast and/or dinner).
    - Review RBS daily at nearest facility and keep record
    - Review in out-patient medical clinic after 5 days
    - After 5–7 days, if GI side effects have not occurred, advance dose to 850mg or 1gm before breakfast and dinner.
    - If GI side effects appear as doses advanced, can decrease to previous lower dose and try to advance dose later.
    - The maximum effective dose is usually 850 mg BD, with modestly greater effectiveness with doses up to 3 g per day. GI side effects may limit the dose that can be used.

  Refer to Diabetic clinic
30. Diabetic Ketoacidosis (DKA) / Hyperosmolar Hyperglycaemic State (HHS) Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

**Introduction**

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

**Electrocardiography**

The information from these 12 leads is combined to form a standard electrocardiogram.

**Venous Glucose**

Venous Glucose reaches 11.1 mmol/L (DKA) or 16.7 (HHS)

**Useful formulas in DKA**

(available in MDCalc)

- **Anion gap** = Na⁺ - [(Cl⁻ + HCO₃⁻)]
- **Serum sodium correction** = Na⁺measured + 1.6 *[Glucose - 5.6] (all values in mmol/L)
- **Serum potassium correction during acidemia** = [K⁺] - (0.6 mmol/L X (7.4 - measured pH) X 10)
- **Serum osmolality (mOsm/L) = 2 [Na⁺ + K⁺] (mmol/L) + Glucose (mmol/L) + BUN (mmol/L)
- **Total body water deficit** (L) = 0.6 *men/children or 0.5 *women x body weight (kg) X [serum Na⁺/140 - 1]
## 31. Electrolyte Abnormalities Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

- Monitor, support ABCs
- Check vital signs (BP, PR, RR, SPO2, T° C, RBS)
- Start Oxygen IF SPO2 < 94%. Maintain SPO2 ≥ 94%
- Establish IV Access and send blood samples for FBC, UEC
- Obtain/review 12-lead ECG for K⁺ abnormalities
- Perform brief, targeted history, physical exam

### Hyponatraemia
- (< 130 mmol/L)

For hypotensive patients, give NS 20 ml/kg bolus and repeat until vital signs are stable

Consult a Physician for ALL Patients

For patients with severe symptoms (vomiting, cardiorespiratory distress, abnormal or deep somnolence, seizures or coma (GCS ≤ 8) (usually in the 100 to 110 mmol/L range), regardless of whether hyponatraemia is acute or chronic: Start IV infusion of 150 ml 3% hypertonic saline over 20 min. Repeat infusion checking the serum sodium concentration every 20 min until a target of 5 mmol/l increase in serum sodium concentration is achieved or until the symptoms improve, whichever comes first.

Consider using weight-based (2 ml/kg) rather than the fixed 150 ml infusion volumes of 3% hypertonic saline in case of obviously deviant body composition. Keep in mind that if hypokalaemia is present, correction of the hyponatraemia will contribute to an increase in serum sodium concentration.

Do not expect patients with severe symptoms to completely recover immediately, as it may take some time for the brain to fully recover.

### Hypernatremia
- (> 150 mmol/L)

### Hypokalaemia
- (< 3 mmol/L)

For hypotensive patients, give RL 20 ml/kg bolus and repeat until vital signs are stable

Consult a Physician for ALL Patients

- Mild-Moderate hypokalaemia
  - (< 2 mmol/l)
  - Giving 40 to 60 mmol of elemental potassium orally every 2 to 4 hours for 3 days.

- Severe hypokalaemia
  - (< 2 mmol/l)
  - Give 40 mmol K⁺ in 1L RL over 1 hour with continuous ECG monitoring.

  Additionally, restoration of normokalaemia relies on the establishment of normomagnesemia as both K⁺ and Mg²⁺ co-transport in the kidney.

  Give 2gm magnesium sulphate along with potassium replacement.

Consult a Physician for ALL Patients

### Hyperkalaemia
- (> 5.5 mmol/L)

For hypotensive patients, give NS 20 ml/kg bolus and repeat until vital signs are stable

Give calcium to protect the heart (not bind K⁺)

- Give 30mls 10% Calcium Gluconate (6.6mmol) over 10mins
- OR
- Give 10mls 10% CaCl₂ (6.8mmol) over 10mins

1. Check RBS. IF RBS ≤ 14mmol/L, give 50mls 50% dextrose IV bolus
2. Then give 10units soluble insulin IV bolus

Repeat 1 & 2 above if repeat K⁺ is > 5.5 mmol/L

Re-check RBS hourly

Nebulise Salbutamol 10 to 20 mg in 4 ml of NS over 10 minutes - 25-40% of patients do not respond secondary to tachyphylaxis.

Serum potassium will be lowered approximately 10 to 30 minutes after the above measures are performed, and the effect will last for 2 to 6 hours.

Consult a Physician for ALL Patients
Introduction
Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

32. Sepsis & Septic Shock Diagnostic Criteria
(SOFA and qSOFA Scores available on MDCalc)
**Sepsis & Septic Shock Algorithm**

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

See 32. Sepsis & Septic Shock Diagnostic Criteria

---

**TO BE COMPLETED WITHIN 1 HOUR OF IDENTIFICATION OF SEPSIS/SEPTIC SHOCK**

- Monitor, support ABCs
- Check vital signs (BP, PR, RR, SPO₂, T°C, RBS)
- Start Oxygen if SPO₂ < 94%. Maintain SPO₂ ≥ 94%
- Establish IV Access and send samples for FBC, MPS, LFTs, UEC, VBG, Serum lactate
- Perform brief, targeted history, physical exam
- Obtaining appropriate cultures before antimicrobial therapy is initiated if such cultures do not cause significant delay in the start of antimicrobial(s). Draw 2 sets of blood cultures 10mL each (both aerobic and anaerobic bottles) from different sites.
- Administer 30ml/kg NS or RL for Hypotension or Lactate ≥ 2 mmol/L
- Give ANTIBIOTICS
  - Ceftriaxone 2gm IV stat
    - For probable Neutropenic patients or if patient has been admitted in hospital in the last 3 months (Hospital Acquired Infection)
      - Imipenem 500 mg IV infusion over 3 hrs then QID for general sepsis
      - Meropenem 1gm IV infusion over 3 hrs then TDS for possible CNS infections
  - Give antipyretic if indicated (Paracetamol 1gm IV)
  - CXR; Urinalysis + MCS; ? Stool MCS; ? CSF MCS
  - Monitor urine output hourly

---

Repeat vital signs (BP, MAP, PR, RR, SPO₂, T°C, Serum lactate) after 1 hour

Features of SHOCK despite adequate fluid resuscitation (> 30ml/kg)?
- □ MAP < 65mmHg
- □ Signs of Shock (tachynoea, cool clammy skin, cool peripheries, hypotensive, tachycardia)
- □ Urine output < 0.5mL/kg/hour
- □ Hyperlactatemia (> 2 mmol/L)

---

**SEPTIC SHOCK**

- Consult a Physician and continue with the algorithm
- Start peripheral vasopressors if MAP < 65mmHg in the face of life-threatening hypotension, even when hypovolemia has not yet been resolved - Norepinephrine (0.1–1.3 µg/kg/min) and/or Adrenaline (0.05-0.3µg/kg/min).
  - Titrate vasopressors to a MAP ≥ 65 mmHg to preserve tissue perfusion.

---

Hemodynamic stability achieved with adequate fluid resuscitation (> 30ml/kg) and vasopressor therapy?
- □ MAP < 65mmHg
- □ Signs of shock as above
- □ Urine output < 0.5mL/kg/hour
- □ Hyperlactatemia (> 2 mmol/L)

---

If evidence of tissue hypo perfusion persists despite adequate intravascular volume and adequate MAP?
- □ Hyperlactatemia (> 2 mmol/L)
- □ Decreased capillary refill or mottling

---

Yes

Admit HDU/ICU

No

Give Hydrocortisone 200mg IV bolus

---

Give Dobutamine infusion up to 20 µg/kg/min (+ vasopressor if in use) in the presence of:
- a) myocardial dysfunction as suggested by elevated cardiac filling pressures and low cardiac output, or
- b) ongoing signs of hypo perfusion, despite achieving adequate intravascular volume and adequate MAP

- Admit HDU/ICU

---

**Consult a Physician**

Consider Admission
### 33. Antimicrobial Guide

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

For detailed guidelines and other conditions not listed below, refer to your hospital’s guidelines for antimicrobial use.

<tr>
<th>Condition</th>
<th>Comments/Caveats</th>
<th>Recommended Therapy</th>
</tr>
</thead>
</table>
| **Urinary Tract Infection (UTI)** | Cloudiness of the urine is most often due to protein or crystal presence, and malodorous urine may be due to diet or medication use. A urinalysis with quantitative urine WBC counts **should NOT be** used alone to support a diagnosis of UTI or start antimicrobial therapy in any patient population. A **negative Leukocyte Esterase AND a negative urine Nitrates** largely rule out infection in pregnant women, elderly patients, family medicine, and urology patients. The combination of a negative leukocyte esterase and negative nitrite test demonstrated a UTI negative predictive value of 88% (95% confidence interval [CI] 84–92%). | **Uncomplicated Cystitis**
  Ciprofloxacin 500 mg PO BD x 3 days  
  OR  
  Nitrofurantoin 100mg TDS x 3 days  
  **Uncomplicated Pyelonephritis, Outpatient Therapy**
  Ceftriaxone 1 g IV stat  
  PLUS
  Ciprofloxacin 500 mg PO BD x 7 days  
  **UTI during Pregnancy, Outpatient Therapy**
  Cefuroxime 500 mg PO BD for 7 days  
  OR  
  Nitrofurantoin 100mg TDS x 3 days  

Pyuria in a urine specimen, in the absence of symptoms (Asymptomatic Bacteruria), is **NOT AN INDICATION** for antimicrobial therapy.

Urine cultures are **NOT RECOMMENDED** in most cases of uncomplicated UTIs in adult women.

**Urine Cultures ONLY for:**
- In patients suspected of having **pyelonephritis**, a urine culture and susceptibility test should always be performed, and initial empiric therapy should be tailored appropriately based on the likely infecting uropathogen.
- A urine specimen should be obtained for culture and susceptibility testing before initial antimicrobial therapy for **complicated UTIs**.

**Complicated UTI**
- Male gender  
- Structural or functional anatomic abnormalities  
- Renal stones  
- Indwelling catheters  
- Renal transplant  
- Neurogenic bladder  
- Recent urologic procedure

**Inpatient therapy**
- Sepsis  
- Pregnancy  
- Urinary tract obstruction  
- Persistent vomiting  
- Poor outpatient follow-up

The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Community Acquired Pneumonia

In addition to a constellation of suggestive clinical features, a demonstrable infiltrate by chest radiograph or other imaging technique, with or without supporting microbiological data, is required for the diagnosis of pneumonia.

The strongest indications for blood cultures are severe CAP and in immunocompromised patients or those with significant co morbidities, as these patients are more likely to be infected with pathogens other than S pneumoniae.

Co morbidities:
- Chronic heart, lung or renal disease
- Diabetes mellitus
- Alcoholism
- Malignancy
- Asplenia
- Immunosuppressant condition or drugs

Inpatient Therapy
- CURB65 ≥ 2 (available in MDCalc)
- Patient factors requiring hospitalization

HCAP risk factors?
- Hospitalization for 2 or more days of the past 90 days
- Resides in nursing home or long-term care facility
- Received chemotherapy, IV antibiotics, or wound care within the prior 30 days
- Attended a hospital or haemodialysis clinic in the last 30 days

Outpatient Treatment
Amoxicillin/Clavulanate 1gm PO BD x 7 - 10 days

In Penicillin-Allergic Patients:
Azithromycin: 500 mg PO on day 1 followed by 250 mg PO OD for 4 days

Inpatient Treatment
Amoxicillin/Clavulanate 1.2gm IV T x 7 - 10 days PLUS Azithromycin 500mg IV OD x 7 - 10 days

Healthcare Associated Pneumonia (HCAP)
Antipseudomonal beta-lactam
Imipenem 500mg IV infusion over 3 hours QID

| Significant bleeding | Including recurrent or prolonged bleeding from the nose, gums or venepuncture sites; haematemesis or melena | Severe Malaria: IV Artesunate 2.4mg/kg at 0, 12 and 24 hours and daily until patient can take oral. Children weighing < 20 kg should receive a higher dose of artesunate (3 mg/kg bw per dose) to ensure equivalent exposure to the drug. |

| Shock | Compensated shock is defined as capillary refill ≥ 3 s or temperature gradient on leg (mid to proximal limb), but no hypotension. Decompensated shock is defined as systolic blood pressure < 70 mm Hg in children or < 80 mm Hg in adults, with evidence of impaired perfusion (cool peripheries or prolonged capillary refill). |

| Hyperparasitemia | P. Falciparum parasitaemia > 10% |

### Community-Acquired Severe Intra-Abdominal Infection, Biliary, and Extra-Biliary Infections

Empiric coverage of Enterococcus is recommended: Piperacillin-Tazobactam 4.5gm IV QID

### Cellulitis/ Abscesses/ Folliculitis/ Carbuncle/ Furuncle

Most abscesses are Staph aureus. Most cellulitis is Group A beta-haemolytic streptococcus (although some is Staph aureus).

Empiric therapy for Streptococcus pyogenes (beta-haemolytic streptococcus) is recommended.

Clindamycin is bacteriostatic, potential for cross-resistance and emergence of resistance in erythromycin-resistant strains; inducible resistance in MRSA.

Effective treatment of abscesses entails incision, thorough evacuation of the pus, and probing the cavity to break up ovoidations. Gram stain, culture, and systemic antibiotics are rarely indicated unless there is extensive surrounding cellulitis, fever, multiple lesions, severely impaired host defences, or cutaneous gangrene.

**Oral Therapy**

Beta-haemolytic Streptococcus coverage: Amoxicillin/Clavulanate 1gm PO BD x 7 days

OR

Clindamycin 450 mg PO QID x 7-10 days

**Parenteral Therapy (Inpatient)**

Beta-haemolytic Streptococcus and MSSA Coverage: Cefazolin 1gm IV q8 hours for 7-10 days

OR

Clindamycin 600 mg IV Q8 hours for 7-10 days

**Necrotizing skin & soft tissue infections**

Surgical intervention is the major therapeutic modality in cases of necrotizing fasciitis.

Necrotizing fasciitis falls into two groups:

- The spontaneous extremity cellulitis is usually Group A Streptococcus and sometime Staph aureus.
- The second group includes head and neck, abdominal/groin and is frequently polymicrobial.

Consult a Surgeon

Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Condition | Comments/Caveats | Recommended Therapy
--- | --- | ---
HIV Post Exposure Prophylaxis (PEP) | • Exposed individual must be HIV negative at baseline
• Exposure must have occurred within the past 72 hours
• Exposure must be high-risk. Faeces, nasal secretions, saliva, sputum, sweat, tears, urine, and vomitus are not considered to be infectious unless they are visibly bloody.
Estimated per-unprotected act risk for acquisition of HIV by exposure route | PEP should be initiated as soon as possible after exposure, but no later than after 72 hours.
Consult local guidelines for the recommended regimens

The overall rate of HIV transmission through percutaneous inoculation is reported to be 0.3% (95% confidence interval [CI] 0.2–0.5); the risk of acquiring an HIV infection is greater for percutaneous injuries that involve:
- hollow-bore needles that have been in contact with an artery or vein,
- when blood is visible on the device,
- a deep needle stick, and
- when the source patient has advanced HIV disease.

Splashes or infectious material to mucous membranes or broken skin may also transmit HIV infection (estimated risk per exposure, 0.09%; 95% CI 0.006–0.5). Exposure of intact skin to contaminated blood has not been identified as a risk for HIV transmission.

- Counsel on risks and benefits of PEP and obtain verbal consent for testing (HIV, FHG, UEC, LFTs, HBV and HCV)
- Voluntary HIV testing for source individuals
- Offer PEP as soon as high-risk exposure is established and exposed individual tests HIV negative at baseline (if HIV testing not available, can provide 1-2 days of PEP to cover until HIV test performed)
- Pregnancy testing
  - Cr (if TDF-containing regimen) and Hb (if AZT-containing regimen), however PEP should be offered even when lab tests are not available. Do not delay administration of PEP while waiting for lab results
  - Hepatitis B vaccination (if not previously immunized & not known HBV positive)
  - PEP should be continued for 28 days (dispense all 28 days of treatment at the first visit)
  - Follow up client at 7 days, 14 days, and 28 days after starting PEP
  - Follow up HIV antibody testing at 3 months, if negative, test again at 6 months after which annual testing applies
  - Assess for and manage side effects due to PEP
  - Follow up with gastroenterologist if positive HBV, HCV and/or abnormal LFTs

Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) “view” the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.
Introduction

The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Brief Suicide Prevention Interventions
For all patients with suicidal ideation who are being discharged:
1. Provide at least one of the following brief suicide prevention interventions prior to discharge.
2. Include crisis center/hotline information with every brief intervention provided.
3. Involve significant other(s) in the intervention if present.

- **Brief Patient Education**: Discuss the condition, risk and protective factors, type of treatment and treatment options, medication instructions, home care, lethal means restriction, follow-up recommendations, and signs of a worsening condition and how to respond. Provide verbal and written information on the nearest crisis hotline.
- **Safety Planning**: Work with the patient to develop a list of coping strategies and resources that he or she can use during or before suicidal crises. Use the Safety Planning resources (paper version or mobile app) provided in the full guide.
- **Lethal Means Counselling**: Assess whether the patient has access to firearms or other lethal means (e.g., prescription medications), and discuss ways to limit access until the patient is no longer feeling suicidal. Follow the Lethal Means Counselling Recommendations for Clinicians sheet available from Means Matter.
- **Rapid Referral**: During the ED visit, schedule an outpatient mental health appointment for the patient within seven days of discharge. If no appointments are available, review additional suggestions in the full guide and/or refer the patient for a follow-up with a primary care provider.
- **Caring Contacts**: Follow up with discharged patients via postcards, letters, e-mail or text messages, or phone calls. See sample messages in the full guide. These communications can be automated.

Discharge Planning Checklist
Involve the patient in the decision-making process. Shared decision-making lowers patient stress, gives patients a sense of control, and leads to better outcomes. Patients with suicide risk report higher satisfaction when they are involved in decisions about their care.

- Patient involved in planning
- Follow-up appointment scheduled for a date within one week of discharge
- Discharge plan reviewed verbally and understood by patient
- Barriers and solutions discussed
- Crisis center phone number provided
- Access to lethal means reviewed and discussed
- Written instructions and education materials provided, including what to do if the patient’s condition worsens and when to return to the ED
- Patient confirms his or her understanding of the patient care plan
- Relevant health information transmitted to referral providers
- Patient senses the provider’s care and concern
Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Management of the severely agitated or violent patient

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient's individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

- Ensure staff safety
- Attempt to calm patient using verbal techniques
- Place physical restraints if necessary
- Monitor, support ABCs.
- Establish IV/O2 monitor if possible. Check vital signs (BP, PR, RR, SPO2, T°C, RBS) if possible.

Call for security or police for any concern about violence or potential violence

Is rapid sedation needed?

No

Yes

Chemical restraint

Severely violent patient
- Haloperidol 5mg to 10mg IV/IM
- OR Midazolam 5mg to 10mg IV/IM
- OR Midazolam 5mg to 10mg IV/IM PLUS Haloperidol 5mg to 10mg IV/IM

Intoxication with CNS stimulant or undifferentiated patient
- Midazolam 5mg to 10mg IV/IM
- OR Midazolam 5mg IV/IM PLUS Haloperidol 5mg IV/IM

Intoxication with CNS depressant (e.g. ethanol)
- Haloperidol 5mg to 10mg IV/IM

Known psychotic/psychiatric disorder
- Haloperidol 5mg to 10mg IV/IM
- OR Haloperidol 5mg to 10mg IV/IM PLUS Midazolam 5mg to 10mg IV/IM

Cooperative patient
- Midazolam 5mg to 10mg PO

In elderly patients, reduce the dose of any antipsychotic by half

Establish IV/O2 monitor if not already in place.
Check vital signs (BP, PR, RR, SPO2, T°C, RBS)

Yes

Sedation achieved?

No

Titrate chemical restraints to desired effect.

- Establish IV/O2 monitor if not already in place.
- Check vital signs (BP, PR, RR, SPO2, T°C, RBS)

Assess for medical causes of agitation
- Hypoglycaemia
- Hypoxia
- Drug overdose
- Poisoning
- Infection
- Intracranial lesion
- Others

GENERAL PRINCIPLES

Select one sedative (benzodiazepine) and one antipsychotic agent and titrate these to a targeted SAT
Avoid switching agents/classes as unpredictable
Use longer acting agents where possible, to avoid the roller coaster effect of agitation/worse sedation

If using RAPID TAKEDOWN agents, be prepared to MANAGE THE AIRWAY inc. REB & CICO

Assessment should occur in a designated area
Explain assessment to patient
Assess situation and patient including airway, breathing and circulatory needs
Administer medications with patient supine...
Introduction
Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG
The six chest leads (V1 to V6) “view” the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

36. Epigastric Pain Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Adult with Epigastric Pain
- Monitor and support ABCs
- Provide immediate analgesia – See Analgesia Chart

- Check vital signs (BP, PR, RR, SPO2, T°C, RBS)
- Start Oxygen IF SPO2 < 94%. Maintain SPO2 ≥ 94%
- Obtain/review 12-lead ECG if > 40 years old, diabetic or hypertensive

Perform a focused history and physical examination, evaluating;
- Duration of symptoms
- Risk factors for potentially serious conditions – ACS, Pancreatitis, DKA, Cholecystitis, Perforate Ulcer, Pre- eclampsia/Eclampsia, HELLP

- Send blood samples for FBC, UEC, Lipase.
- Additional testing as indicated;
  - hsTroponin T - ? ACS (elderly (>50yrs), diabetics, hypertensives)
  - LFTs - ? Cholecystitis, Pre-eclampsia/Eclampsia, HELLP
  - Erect CKR - ? Perforated ulcer, Pancreatitis, Pneumonia
  - VBG – Hyperglycaemic patients, Pancreatitis
  - PDT - ? Ectopic pregnancy

Probable Dyspepsia
- Stool H. Pylori Antigen Test (see indications)
- Antacid Gel PRN + Ranitidine 50 mg IV

H. Pylori Positive
- Symptomatic Treatment
  - Antacid Gel 20-60mins after meals and at bedtime or PRN (for symptom control)
  - Paracetamol (stop ALL NSAID use)
  - Dietary advice
  PLUS
  Eradication Therapy

<table>

*Standard doses are esomeprazole 20 mg, lansoprazole 30 mg, omeprazole 20 mg, pantoprazole 40 mg, and rabeprazole 20 mg

Consider OGD (see indications below)

H. Pylori Negative
- Symptomatic Treatment
  - Antacid Gel 20-60mins after meals and at bedtime or PRN (for symptom control)
  - Paracetamol (stop ALL NSAID use)
  - Dietary advice
  PLUS
- Acid Suppression Therapy
  - PPI standard dose x 4 weeks

Consider OGD (see indications below)

Indications for Stool H. pylori Antigen testing
1. Active peptic ulcer disease (PUD),
2. History of PUD (unless previous cure of H. pylori infection has been documented),
3. Low-grade gastric mucosa-associated lymphoid tissue (MALT) lymphoma,
4. History of endoscopic resection of early gastric cancer (EGC)
5. Patient with un-investigated dyspepsia under the age of 60 years and without alarm features
6. Patients taking long-term, low-dose aspirin
7. Patients with unexplained iron deficiency anaemia despite an appropriate evaluation
8. Adults with idiopathic thrombocytopenic purpura (ITP)

Indications for Oesophagastroduodenoscopy (OGD)
- age ≥ 60 yr
- bleeding
- anaemia
- early satiety
- unexplained weight loss (>10% body weight)
- progressive dysphagia
- odynophagia
- persistent vomiting
- a family history of gastrointestinal cancer
- previous oesophagastroduodenal malignancy
- previous documented peptic ulcer
- lymphadenopathy
- an abdominal mass
**Introduction**

The information from these 12 leads is combined to form a standard electrocardiogram.

---

**37. Upper Gastrointestinal Bleeding Algorithm**

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

**Upper Gastrointestinal Bleeding** can vary in presentation, but most cases present in one or more of four ways as follows:

a) Melena (69%): the passage of dark and pitchy stools stained with blood pigments or with altered blood. Melena is caused by the passage of at least 50 mL of blood in the upper GI tract. Bacteria degrade the blood into haematin or other haemachromes. Melena should not be confused with the dark stools that result from ingestion of iron or bismuth.

b) Haematemesis (30%): the vomiting of bright red blood and indicates an upper GI site of bleeding, usually above the ligament of Treitz.

c) Coffee-ground emesis (28%): emesis consisting of dark, altered blood mixed with stomach contents

d) Haematochezia (15%): the passage of bloody faeces

---

**SHOCKED (HYPOTENSIVE)**

- Monitor, support ABCs in ER; Intubate patient if airway is at risk from massive haematemesis
- Check vital signs (BP, PR, RR, SPO2, T° C, RBS)
- Start Oxygen IF SPO2 < 94%. Maintain SPO2 ≥ 94%
- Establish 2 large bore IV accesses (14-16G).
- Give rapid fluid boluses at 20mL/Kg Ringer’s Lactate/Hartmann’s soln; repeat if necessary.
- Start blood transfusions ONLY if Hb < 7 g/dL.
- Send samples for FBC, UEC, LFTs, VBG, Coagulation screen.
- Crossmatch 6 units of packed cells.
- Perform brief, targeted history, physical exam including a rectal exam
- Insert NGT ONLY if intubated or has recurrent vomiting uncontrolled by anti-emetics

**NOT SHOCKED**

- Monitor, support ABCs in ER; Intubate patient if airway is at risk from massive haematemesis
- Check vital signs (BP, PR, RR, SPO2, T° C, RBS)
- Start Oxygen IF SPO2 < 94%. Maintain SPO2 ≥ 94%
- Establish a large bore IV access (14-16G).
- Start IV Fluids TKVO – Ringer’s Lactate (RL)/Hartmann’s soln. Start blood transfusions ONLY if Hb < 7 g/dL.
- Send samples for FBC, UEC, LFTs, VBG, Coagulation screen, Blood type & screen.
- Perform brief, targeted history, physical exam including a rectal exam

- IV omeprazole (80-mg bolus followed by 8 mg/h for 72 h). Use pantoprazole if patient is on Clopidogrel.
- Monitor vital signs every 15 min until stable, then hourly.
- Correct hypotension with repeat fluid boluses/blood transfusion
- Monitor urine output – Aim for > 0.5mL/Kg/h

- Consult Gastroenterologist
- Admit HDU/ICU
38. Poisoning

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Decontamination
Activated Charcoal

<table>
<thead>
<tr>
<th>Indications</th>
<th>Contraindications/Not helpful/Caution</th>
<th>Dosing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use ONLY within ONE HOUR of ingestion of a potentially toxic amount of medication. It is NOT effective beyond this period unless in multi-dose indications.</td>
<td></td>
<td>The optimal dose of charcoal is unknown. However, the adult dose ranges from 50 to 100 g per dose. Lower doses of 0.5-1gm/kg is used in children. When drug-induced vomiting is anticipated (for example, with a theophylline overdose), an IV antiemetic is recommended. Cathartics such as sorbitol are sometimes added to activated charcoal preparations, but there is no evidence of any additional clinical benefit.</td>
</tr>
<tr>
<td>Multiple-dose (30gm in 400mls 4-6hrly) activated charcoal should only be considered if a patient has ingested a life-threatening amount of Theophylline, Phenobarbital, Dapsone Carbamazepine, or Quinine. (Mnemonic - These People Drink Charcoal Quickly)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

DO NOT PERFORM GASTRIC LAVAGE
Clinical studies have failed to show that gastric lavage improves the severity of illness, recovery times, or the ultimate medical outcomes and may be associated with life-threatening complications (aspiration pneumonitis, oesophageal or gastric perforation, fluid and electrolyte imbalances, arrhythmia).

Antidotes

<table>
<thead>
<tr>
<th>Antidote</th>
<th>Indications</th>
<th>Dose</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>N-acetylcycteine (NAC)</td>
<td>If it is likely that the patient has ingested &gt; 150 mg/kg (or &gt;10 g) of paracetamol In contrast, NAC is not recommended for patients with; an unknown ingestion time, a paracetamol concentration below detectable limits along with normal AST levels.</td>
<td>150 mg/Kg IV over 1 hr then 50mg/Kg over the next 4 hrs then 100mg/Kg over the next 16hrs IV NAC should be infused as a 3% solution (30 g of NAC in D5W to a total volume of 1 L</td>
<td>Anaphylactoid reaction if given too fast</td>
</tr>
<tr>
<td>Atropine</td>
<td>Organophosphate/Carbamate poisoning causing rhinorrhoea, lacrimation, dyspnoea, vomiting, fasciculations, weakness, inability to ambulate, convulsions, respiratory insufficiency, coma. Miosis alone is not an indication for atropine administration.</td>
<td>2mg IV repeated every 5 minutes until the therapeutic endpoint is reached i.e. until pulmonary secretions are dried (reflected by improved oxygenation) and ease of breathing or ease of ventilation.</td>
<td>Excessive doses of atropine can result in delirium, agitation, and tachycardia and hypertension. Tachycardia is not a contraindication to atropine administration.</td>
</tr>
<tr>
<td>Ethanol</td>
<td>Ethylene Glycol or Methanol poisoning</td>
<td>PO: Loading dose: 0.8g/kg in a 20% ethanol solution diluted in juice. Maintenance dose: 80mg/kg/h; increase to maintain a serum ethanol concentration of 100-150mg/dL. IV: Loading dose: 0.6 - 0.8 g/kg in a 10% ethanol solution in D5W (volume/volume). Maintenance dose: 80 to 130 mg/kg/h</td>
<td>Higher maintenance doses are used in patients with chronic alcoholism or during haemodialysis.</td>
</tr>
<tr>
<td>Flumazenil</td>
<td>Excessive sedation known to be due to the use of benzodiazepines in a patient without known contraindications (e.g., procedural sedation).</td>
<td>10µg/kg IV over 15 seconds. Repeat every 2-3mins to a maximum of 1mg (usual range 0.3 to 0.6mg). *Fomepizole dosing available in MDCalc</td>
<td>The administration of flumazenil to patients with undifferentiated coma can precipitate seizures in benzodiazepine-dependent patients and has been associated with seizures, arrhythmia, and hypotension in patients with co-ingestion of certain medications, such as tricyclic antidepressants.</td>
</tr>
<tr>
<td>Naloxone</td>
<td>Respiratory depression secondary to an opioid overdose</td>
<td>Dilute one ampoule (0.4mg/ml) into 10ml (0.04mg/ml) and give 1 ml every 1 to 2 minutes. A therapeutic effect is usually seen after 3 to 4 ml</td>
<td>Rapid injection may result in an acute withdrawal syndrome, with severe sympathetic effects such as hypertension, tachycardia and pulmonary oedema - can precipitate a myocardial infarction in patients at risk of IHD.</td>
</tr>
</tbody>
</table>
39. Organophosphate Poisoning Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

**DECONTAMINATION AND PERSONAL PROTECTION**
- WEAR PERSONAL PROTECTIVE EQUIPMENT (Gloves, Gowns and Masks)
- REMOVE ALL CLOTHING from and gently cleanse the patient with soap and water. Consider clothing and PPEs as hazardous waste and discard accordingly

The action of acetylcholine released into a synaptic cleft or neuromuscular junction is normally terminated when the enzyme acetylcholinesterase cleaves acetylcholine into choline and acetic acid. Organophosphates bind to the active site of the cholinesterase enzymes causing an increase in the acetylcholine concentration and a marked hyperstimulation of the cholinergic system, which is responsible for the predominant signs of toxicity.

**Muscarinic Manifestations**
- Ophthalmic: Conjunctival injection, lacrimation, miosis, blurred vision, diminished visual acuity, ocular pain
- Respiratory: Rhinorrhea, stridor, wheezing, cough, excessive sputum, chest tightness, dyspnoea, apnoea
- Cardiovascular: Bradycardia, arrhythmias, hypotension
- Dermal: Flushing, diaphoresis, cyanosis
- Gastrointestinal: Nausea, vomiting, salivation, diarrhoea, abdominal cramping, tenesmus, faecal incontinence
- Genitourinary: Frequency, urgency, incontinence

**Nicotinic Manifestations**
- Cardiovacular: Tachydysrhythmias, hypertension
- Striated muscle: Fasciculations, twitching, cramping, weakness, paralysis

**Central Nervous System**
- Anxiety, restlessness, depression, confusion, ataxia, tremors, convulsions, coma, areflexia, respiratory depression

*Parasympathetic nervous system manifestations (DUMBELS – Diarrhoea, Urination, Miosis, (Bradycardia, Bronchoconstriction, Bronchorrhea) Emetics, Lactimation, Salivation)

**Indications for Atropine treatment** (Miosis alone is NOT an indication for atropine administration)

<table>
<thead>
<tr>
<th>Symptoms</th>
<th>Severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rhinorrhea, lacrimation, or mild dyspnoea</td>
<td>Mild</td>
</tr>
<tr>

<td>Moderate</td>
</tr>
<tr>
<td>Seizures*, coma, respiratory insufficiency</td>
<td>Severe</td>
</tr>
</tbody>
</table>

* Tachycardia can occur in organophosphate poisoning due to stimulation of the sympathetic ganglia as well as respiratory distress and hypoxia. Tachycardia is NOT a contraindication to atropine administration.

Atropine doses should be repeated every 5 minutes until the therapeutic endpoint (Atropinisation) is reached i.e. until pulmonary secretions are dried [reflected by improved oxygenation] and ease of breathing [or ease of ventilation]), a pulse rate > 80 beats per minute and systolic blood pressure > 80mm/Hg.

Start atropine infusion when atropinisation achieved: 0.05mg/kg/hour. E.g. for a 70kg patient give 3.5 mg of atropine per hour as an infusion. Put 10mg of atropine in 200mL of fluid run at 40 – 80mL per hour (2-4mg/hr) depending on response.

**Precautions**
- Excessive doses of atropine can result in deleterious effects including delirium, agitation, and tachycardia and hypertension. Atropine will likely NOT improve miosis or skeletal muscle paralysis (nicotinic receptors); therefore, reversal of these effects is not a therapeutic endpoint. Attempting to reverse these findings with atropine can result in administration of excessive doses of atropine.

**Seizure control**
(Midazolam 0.1mg/kg or Diazepam 0.1mg/kg)

Benzodiazepines are needed to prevent or treat nerve agent–induced seizures in moderate to severe toxicity because anticholinergic treatment is increasingly less effective from 5 – 40 minutes post exposure. Phenytoin does NOT affect GABA-A and has been found to be ineffective in controlling organophosphate–induced seizures. Benzodiazepines should be infused rapidly to unresponsive patients who have been exposed to organophosphates, since such patients may have non-

**Pralidoxime (2-PAM)**

**WHO recommendation is > 30-mg/kg IV/IM bolus followed by > 8-mg/kg/hour IV infusion**

(Adults: 2 g IM or slow IV infusion over 15 to 30 minutes followed by a 500-mg/hour infusion)

Neither atropine nor benzodiazepines will alleviate symptoms affecting the nicotinic system (CNS, NMJ, autonomic ganglia). 2-PAM should be given to any patient exposed to an organophosphate nerve agent who is showing any systemic toxicity especially fasciculations or weakness. The initial dose should be given as quickly as possible. Caution: Delivering 2-PAM more rapidly than recommended can result in hypertension. This is usually self-limited, but in extreme cases, phenolamine 5 mg IV may be effective. Laryngospasm and rigidity can also occur with rapid IV administration.

**Disposition**
- Consult a Physician
- Continue atropine infusion until the therapeutic endpoint (Atropinisation) is reached i.e. until pulmonary secretions are dried [reflected by improved oxygenation] and ease of breathing [or ease of ventilation]).
- Admit ALL symptomatic patients. Severe poisoning should be admitted to an ICU
40. Alcohol (Methanol) Poisoning Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient's individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Suspected Methanol Poisoning

Methanol toxicity commonly affects the neurological, ophthalmological, and gastrointestinal systems.

- Within the first 24 hours, central nervous system (CNS) depression, euphoria, and inebriation occur.
- This is followed by a latent period (between 6 and 30 hours) during which methanol is metabolized to formic acid, which ultimately leads to systemic effects.
- Ophthalmologic symptoms can range from blurry vision, decreased visual acuity, and photophobia to blindness or the classic "snowstorm" vision. A complaint of blurred vision with a relatively clear sensorium should strongly suggest the diagnosis of methanol poisoning. Initially, visual fields are not affected, and patients may have a central scotoma (blind spot). If unrecognized and not appropriately treated, these changes will result in:
  - permanent blindness
  - absent papillary response, and
  - permanent optic nerve atrophy.
- Methanol toxicity causes gastrointestinal symptoms such as abdominal pain with or without evidence of pancreatitis and/or hepatotoxicity.

In severe cases, the odor of formaldehyde may be present on the breath or in the urine. Untreated methanol poisoning is associated with a rate of death of 28% and a rate of visual deficits or blindness of 30% in survivors.

- Monitor, support ABCs; Consider Advanced Airway or nursing in recovery position for airway protection
- Check vital signs (BP, PR, RR, SPO₂, T°C, RBS).
  - Start Oxygen if SPO₂ < 94%. Maintain SPO₂ ≥ 94%
  - If Hypoglycaemic (RBS < 3.3 mmol/L), give 50mls 50% dextrose IV (see 28. Hypoglycaemia Algorithm). Also, give 100mg Thiamine IV followed by 100mg PO BD for 6 weeks.
- Send samples for FBC, UEC, LFTs, Lipase, VBG, toxicology. Correct any electrolyte imbalances (see 31: Electrolyte Abnormalities Algorithm)
- Start IV Fluids – If hypotensive give repeated NS/RL boluses at 20ml/kg until perfusion is restored (MAP > 65) and dehydration is corrected. More rapid administration and large amounts of fluid may be needed in some patients. When stable, start 5% dextrose saline infusion at 3L/24 hrs
- Perform brief, targeted history, physical exam
- **DO NOT PERFORM GASTRIC LAVAGE.** If the patient’s airway is protected, anecdotal evidence supports the use of gastric aspiration if large amounts of alcohol have been ingested and the patient can be treated very quickly (within an hour) after the ingestion.
- **DO NOT GIVE ACTIVATED CHARCOAL** unless the patient has co-ingested other poisons (see 38. Poisoning Algorithm for indications and contraindications for activated charcoal)

**Give Ethanol (also see 38. Poisoning Algorithm)**

Based on in vitro studies, ethanol’s affinity for alcohol dehydrogenase is more than that of methanol by 15-fold and thus competes for the enzyme preventing methanol from being metabolized to the toxic metabolite, formic acid. Ethanol may be given orally or through an intravenous infusion.

**Oral Dose:**

- Loading dose: 0.8g/kg in a 20% ethanol solution diluted in juice.
- Maintenance dose: 80mg/kg/h; increase to maintain a serum ethanol concentration of 100-150mg/dL.

**IV Dose:**

- Loading dose: 0.6 - 0.8 g/kg in a 10% ethanol solution in D5W (volume/volume).
- Maintenance dose: 80 to 130 mg/kg/h

Higher maintenance doses are used in patients with chronic alcoholism or during haemodialysis.

**Side effects of ethanol treatment include:** hypoglycaemia, CNS depression, intoxication, thrombophlebitis, and hypotension.

- Consult a Physician
- Monitor, support ABCs, Vital signs (BP, PR, RR, SPO₂, T°C, RBS), UEC and VBG.
- Consider haemodialysis for large methanol ingestions, severe metabolic acidosis (pH < 7.25-7.30), vision abnormalities, renal failure, electrolyte abnormalities not responsive to conventional treatment, haemodynamic instability refractory to intensive care treatment and serum concentration > 50mg/dL
- Transfer to ICU
41. Pain Management Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

**Introduction**

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

**How to do an ECG**

The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

---

**ACUTE SOMATIC PAIN**

**EVALUATE:** Focused history, detailed pain assessment

Assign SEVERITY SCORE (1-10)

- MILD PAIN (1-3/10)
  - PO Paracetamol or NSAID + Adjuvant interventions (Non-Pharmacologic)

- MODERATE PAIN (4-6/10)
  - As for mild Pain + Weak opioids e.g. PO tramadol, codeine, hydrocodeine

- SEVERE PAIN (7-10/10)
  - As for mild Pain + Strong opioids e.g. morphine, fentanyl ± non-opioid analgesics

Investigate and treat the cause of pain.

- See Analgesia Chart
- Reassess pain within 15 minutes to ensure relief, monitor patient appropriately, and document
- Repeat analgesic, titrate to a higher dose, initiate a more potent analgesic or combine analgesics with different mechanisms of action as is appropriate to relieve pain
- Treat the cause of pain as OP/IP, and consult/refer appropriately
- Beware of contraindications, allergies, toxicity, interactions with other meds etc. Pethidine (meperidine) has an active metabolite (nor-meperidine) that causes neuro excitation (apprehension, tremors, delirium, and seizures) and may interact with antidepressants (contraindicated with MOI and best avoided with SSRIs), so it is NOT RECOMMENDED for repetitive use. It is also highly addictive.
- Use the PO, SC or IV route, except when that is not possible
- Adjuvant interventions include IMMOBILIZATION, SPLINTAGE, POSITIONING, ELEVATION, ICE etc.

**NSAIDS** are the recommended 1st line therapy for Sickle Cell Pain Crisis, Renal Calculi and Acute Gout.

Metoclopramide is the recommended 1st line therapy for Acute Migraine Headaches

**REGIONAL ANAESTHESIA**

**Indications**
- Acute pain management for wounds, fractures and dislocations
- Alternative to procedural sedation
- Alternative to narcotics in certain patient populations (e.g. head injured patient, patients with concomitant mental status change, patients given buprenorphine)

**Contraindications**
- Allergy to local anaesthetic agents
- Active infection at the site of injection
- Injuries at risk of compartment syndrome
- Uncooperative patient
- Pre-existent neurologic deficit
- Anticoagulation (relative)

**Technique — [www.nysora.com](http://www.nysora.com)**

**Types**
- Wrist (Ulnar, Median and Radial nerve) block for the hand
- Digital nerve blocks for fingers and toes
- Femoral nerve block for the anterior thigh, femur, knee and skin anaesthesia over the medial aspect of the leg below the knee
- Facial and dental nerve blocks
- Ankle blocks for the foot
- Haematoma blocks

**Anaesthetic - Lidocaine**
- Dose – 3mg/kg
- Onset of action - < 2 mins
- Duration – 60 mins

---

emergencymedicinekenya.org
42. Low Back Pain Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Adult with Low Back Pain (LBP)
- Monitor and support ABCs
- Provide immediate analgesia – see Analgesia Chart

Perform a focused history and physical examination, evaluating:
- Duration of symptoms
- Risk factors for potentially serious conditions (tumour, infection, cauda equina syndrome, ankylosing spondylitis or vertebral compression fracture).
- Symptoms suggesting radiculopathy or spinal stenosis
- Presence and level of neurologic involvement - All patients should be evaluated for the presence of rapidly progressive or severe neurologic deficits, including motor deficits at more than 1 level, faecal incontinence, and bladder dysfunction.
- Psychosocial risk factors

Any potentially serious conditions (RED FLAGS) strongly suspected?
The possibility of low back pain due to problems outside the back, such as Ectopic pregnancy, Pancreatitis, Nephrolithiasis, or Aortic Aneurysm, or Systemic illnesses, such as endocarditis or viral syndromes, should be considered.

Perform diagnostic studies to identify cause (see Diagnostic Work-up for Low Back pain)
DO NOT routinely obtain imaging or other diagnostic tests in patients with nonspecific low back pain. Early, routine imaging and other tests usually cannot identify a precise cause, do not improve patient outcomes, and incur additional expenses.

Specific cause identified

Yes
- Consult appropriately

No
- Back pain is mild with no substantial functional impairment Inform all patients of the generally favourable prognosis of acute low back pain with or without sciatica, including a high likelihood for substantial improvement in the first month

- Advice about self-care;
  - Advice to remain active
  - Application of superficial heat
- Discuss non-invasive treatment options;
  - Pharmacologic;
    - 1st line – NSAIDs
    - 2nd line – Tramadol – for severe, disabling pain that is not controlled (or is unlikely to be controlled) with acetaminophen and NSAIDs.
  - Non-pharmacologic – Physiotherapy

Arrive at shared decision regarding therapy trial
Educate patient

Patient accepts risks and benefits of therapy

No
- Refer to Orthopaedic Clinic

Yes
Continue self-care and non-invasive options (analgesia and physiotherapy)
Discharge and reassess in 4 weeks in Orthopaedic Clinic if necessary

RED FLAGS FOR LOW BACK PAIN (TUNAFISH)
- Trauma
- Unexplained weight loss
- Neurologic symptoms
- Age > 50 years
- Fever
- Intravenous drug use
- Steroid use
- History of cancer

*Level of evidence for diagnostic evaluation is variable.
43. Management of Pain in Sickle Cell Disease Algorithm

This clinical pathway is intended to supplement, rather than substitute for, professional judgment and may be changed depending upon a patient’s individual needs. Failure to comply with this pathway does not represent a breach of the standard of care.

Patient presents with acute pain

- Monitor and support ABCs
- Check vital signs (BP, PR, RR, SPO₂, T°C, RBS)
- Start Oxygen if SPO₂ < 92% or if patient is dyspnoeic. Maintain SPO₂ ≥ 92%
- Perform brief, targeted history, physical exam
- Determine probable cause and precipitating factors for pain e.g. infection
- Establish IV Access and send blood samples as below.

Related to SCD

- Yes
- Perform appropriate work-up

No

Start D5 ½ Normal Saline (NS)* at a maintenance rate unless the patient is overtly hypovolemic (sepsis, diarrheal illness, vomiting) in which case resuscitate appropriately.

*In vitro and in vivo studies have shown that lowering of serum osmolality with hypotonic fluid can reduce erythrocyte sickling. Over-hydration — especially with isotonic crystalloid — does not cure crisis and may have detrimental effects.

Mild or Moderate Pain

- Administer IV dose of opiate
  - Tramadol IV/SC - 50-100mg over 3-5mins. Max 400mg/d
  - Fentanyl 1μg/kg every 1-2hrs
- Consider adjuvant therapy (IV paracetamol 15mg/kg)

Assess degree of relief every 15-30 mins

- Yes
- Assess degree of relief every 15-30 mins

- No
- Drop in pain score of ≥ 2

Mild Pain

- Drop in pain score of ≥ 2

- Yes
- Consult a Physician/Haematologist

- No
- Manage cause/precipitating factor
- Disposition with short (< 72 hours) opiate/NSAIDs prescription with haematology follow-up

Investigations:

Full Blood Count (FBC);
- Most patients with HbSS disease have a baseline haemoglobin level of 6 to 9 g/dL and tolerate this level of anaemia well because of physiologic adaptations.
- WBC is NOT a particularly sensitive nor specific indicator for infection

Reticulocyte count - normally elevated (>5%). Levels < 5% are a serious cause for concern as it signifies bone marrow hypoplasticity. In patients with worsened scleral icterus, back pain, fever, or signs that suggest haemolysis, additional tests would include; LFTs and LDH

Renal function tests

Blood typing and screening is necessary if haemoglobin has dropped > 1 mg/dL below baseline or if there is concern that the patient may need a transfusion. Indications for blood transfusion; Severe anaemia - ↓ Hb > 2g/dL below steady state or < 6g/dL; Acute chest syndrome; Priapism; CVA in children; Before surgery
Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Procedural Sedation and Analgesia (PSA)

Procedural sedation is the technique of administering sedatives or dissociative agents with or without analgesics to induce a state that allows the patient to tolerate unpleasant procedures while maintaining cardiorespiratory function.

Potential indications for procedural in the ED: fracture reduction, joint reduction, incision and drainage, chest tube placement, electrocardioversion, upper endoscopy (with a gastroenterologist), foreign body removal, burn or wound debridement

Patient selection: A pre-procedural history and physical exam, as documented in the ED record, should reflect a focused evaluation of the airway, cardiovascular status, pulmonary status, allergies, and history of prior adverse reactions to sedatives or anaesthetics. PSA may not be ideal for patients with significant chronic morbidities e.g. sleep apnoea, COPD, low baseline oxygen saturations or blood pressure, or anatomic features that would make bag valve mask (BVM) ventilation or maintaining an airway difficult.

Preparation: Monitoring equipment (continuous telemetry, pulse oximetry, BP; consider continuous end tidal CO₂ monitoring), peripheral IV, Ringer’s Lactate/Hartmann’s Solution, medications for PSA, naloxone (if opiates are given), equipment for procedure (e.g. scalpel), team (minimum one practitioner for sedation, one for procedure – ONE OF THEM MUST BE PROFICIENT IN AIRWAY MANAGEMENT), airway equipment (oxygen source, nasal cannula/face mask, BVM, suction), rescue airway equipment (endotracheal tube, laryngoscope, LMA, nasal trumpet)

OBTAIN CONSENT for ALL PSA Procedures

Medication for PSA - give both an Analgesic AND a Sedative unless using Ketamine which is both

<table>
<thead>
<tr>
<th>Drug</th>
<th>Dosage</th>
<th>Analgesic/Sedative</th>
<th>Onset/Peak Effect</th>
<th>Duration of Action</th>
<th>Adverse Effects</th>
<th>Comments/Caveats</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ketamine</td>
<td>1 mg/kg IV over 30-60 seconds</td>
<td>Analgesic and Sedative</td>
<td>Onset 1min; Peak effect 1 min</td>
<td>5 - 10mins</td>
<td>Laryngospasm (0.3%), hyper salivation, vomiting, emergence reaction</td>
<td>Ketamine is preferred for patients with hemodynamic instability or renal insufficiency.</td>
</tr>
<tr>
<td>Fentanyl</td>
<td>0.5 – 3 µg/kg IV over 3-5mins</td>
<td>Analgesic</td>
<td>Immediate onset, Peak effect 2-3mins</td>
<td>30 - 45mins</td>
<td>Chest wall rigidity and respiratory depression may occur with rapid IV administration</td>
<td>Fentanyl is preferred for a rapid onset of analgesia in acutely distressed patients.</td>
</tr>
<tr>
<td>Midazolam</td>
<td>0.05 – 0.15mg/kg IV</td>
<td>Sedative</td>
<td>Onset 3-5 mins; Peak effect 15-30 mins</td>
<td>20 - 60mins</td>
<td>Respiratory depression, hypotension</td>
<td>Midazolam has a rapid onset and short duration and is classed as an ultra-short acting benzodiazepine and is 2 to 3 times more potent than diazepam, so can produce significant respiratory depression. Blood pressure decreases, and heart rate increases as compensation for a decreased SVR, although CO remains unchanged.</td>
</tr>
</tbody>
</table>
Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Difficult Airway Features

Difficult Laryngoscopy: Look externally, Evaluate 3-3-2 rule, Mallampati score, Obstruction, Neck Mobility
Difficult BVM Ventilation: Beard, Obese, No teeth, Elderly, Sleep Apnea / Snoring
Difficult LMA: Restricted mouth opening, Obstruction, Distorted airway, Stiff lungs or c-spine
Difficult Cricothyroidotomy: Surgery, Hematoma, Obesity, Radiation distortion or other deformity, Tumor*

Is this patient a good candidate for ED procedural sedation and analgesia?

The less cardiorespiratory reserve, the more difficult airway features, and the more procedural urgency, the more likely the patient should not receive PSA in the emergency department. If not a good candidate for ED-based PSA, other options include regional or local anesthetic; PSA or GA in the operating room; or endotracheal intubation in the ED.

Pre-procedure Preparation

- Analgesia - maximal patient comfort prior to PSA
- Informed consent for PSA and procedure
- Patient on monitor: telemetry, NIBP, SpO2, EtCO2
- Oxygenate with NC O2 and high flow face mask O2
- Select and draw up PSA agent(s)
- Reversal agents and paralytic vials at bedside
- Prepare for endotracheal intubation

Airway Equipment

- Ambu bag connected to oxygen
- Laryngoscopy handles and blades
- Suction, oral & nasal airways
- Endotracheal tubes & stylets
- LMA with lubricant and syringe
- Colorimetric capnometer
- Bougie & difficult airway equipment

Agent | Dose* | Contraindications | Comments
--- | --- | --- | ---
Ketamine | 1-2 mg/kg IV over 30-60 sec or 4-6 mg/kg IM, repeat half dose pm | Absolute: age < 3 months, schizophrenia
Relative: major posterior oropharynx procedures; history of airway instability, tracheal surgery, or tracheal stenosis; active pulmonary infection or disease; cardiovascular disease; CNS masses, abnormalities, or hydrocephalus | Preferred for longer procedures; avoid if hypertension/ tachycardia is a concern; have midazolam available to manage emergence distress; muscle tone is preserved or increased; post-procedure emesis may be mitigated by prophylactic ondansetron
Etomidate | 0.1-0.15 mg/kg IV, then 0.05 mg/kg q3-5 min pm | Intra-procedure myoclonus or hypotension, as well as post-procedure emesis, are common
Fentanyl | 1-2 mcg/kg IV, then 1 mcg/kg q3-5 min pm | Comparatively delayed onset of action; do not re-dose too quickly
Midazolam | 0.5 mg/kg IV, then .05 mg/kg q3-5 min pm | Pregnancy, allergy to benzyl alcohol
Pentobarbital | 1 mg/kg IV, then 1 mg/kg q3-5 min pm | Pregnancy, porphyria
Reversal Agent | Dose | Caution
Naloxone | 0.01-0.1 mg/kg IV or IM (typical adult dose 0.4 mcg), max 2 mg | Only use in benzodiazepine naïve patient
Flumazenil | 0.01 mg/kg IV (typical adult dose 0.2 mg) over 20 seconds, max 1 mg | Only use in benzodiazepine naïve patient

*All doses should be reduced in the elderly and in patients with marginal hemodynamics

Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.

Post-procedure Assessment

- Adverse events: none / hypoxia (< 90%) / aspiration / hypotension / agitation / other: _________________
- Interventions taken: none / bag valve mask / LMA / ETT / reversal agent / hypotension Rx / admission for PSA / other: _________________
- Adequacy of PSA: nondistressed / mild distress / severe distress
- Procedure: successful / unsuccessful
- MD or RN at bedside until patient responds to voice
- Telemetry, ETCO₂, SpO₂ monitoring until patient responding to questions appropriately
- If reversal agent used, observation two hours after answering questions appropriately
- Mental status and ambulation at baseline at time of discharge/disposition

*IM administration is generally NOT RECOMMENDED* due to its multiple disadvantages: Painful administration, Unpredictable absorption, Complications involving tissue fibrosis and abscesses, and Rapid declines in analgesic effect.
*Subcutaneous (SC) administration provides similar pharmacokinetics with greater patient comfort. The SC route should replace the IM route for opioids.*

Introduction

Electrocardiography is a fundamental part of cardiovascular assessment. It is an essential tool for investigating cardiac arrhythmias and is also useful in diagnosing cardiac disorders such as myocardial infarction. Familiarity with the wide range of patterns seen in the electrocardiograms of normal subjects and an understanding of the effects of noncardiac disorders on the trace are prerequisites to accurate interpretation.

How to do an ECG

The six chest leads (V1 to V6) "view" the heart in the horizontal plane. The information from the limb electrodes is combined to produce the six limb leads (I, II, III, aVR, aVL, and aVF), which view the heart in the vertical plane. The information from these 12 leads is combined to form a standard electrocardiogram.
